Constraint Satisfaction Problems: Overview

Chapter overview: constraint satisfaction problems

- ▶ 22.–23. Introduction
- ▶ 24.–26. Basic Algorithms
- ▶ 27.–28. Problem Structure
  - ▶ 27. Constraint Graphs
  - ▶ 28. Decomposition Methods

27. Constraint Satisfaction Problems: Constraint Graphs

#### Motivation

- $\triangleright$  To solve a constraint network consisting of n variables and k values,  $k^n$  assignments must be considered.
- ▶ Inference can alleviate this combinatorial explosion, but will not always avoid it.
- ▶ Many practically relevant constraint networks are efficiently solvable if their structure is taken into account.

27. Constraint Satisfaction Problems: Constraint Graphs

### Constraint Graphs

### Definition (constraint graph)

Let  $C = \langle V, dom, (R_{uv}) \rangle$  be a constraint network.

The constraint graph of C is the graph whose vertices are V and which contains an edge between u and v iff  $R_{uv}$  is a nontrivial constraint.

27. Constraint Satisfaction Problems: Constraint Graphs Constraint Graphs: Example Coloring of the Australian states and territories WA TASMANIA

27. Constraint Satisfaction Problems: Constraint Graphs

# 27.2 Unconnected Graphs

### Unconnected Constraint Graphs

### Proposition (unconnected constraint graphs)

If the constraint graph of C has multiple connected components, the subproblems induced by each component can be solved separately.

The union of the solutions of these subproblems is a solution for C.

#### Proof.

A total assignment consisting of combined subsolutions satisfies all constraints that occur within the subproblems. From the definitions of constraint graphs and connected components, all nontrivial constraints are within a subproblem.

27.3 Trees

## Unconnected Constraint Graphs: Example

example: Tasmania can be colored independently from the rest of Australia.

#### further example:

27. Constraint Satisfaction Problems: Constraint Graphs

network with k = 2, n = 30 that decomposes into three components of equal size

savings?

only  $3 \cdot 2^{10} = 3072$  assignments instead of  $2^{30} = 1073741824$ 

M. Helmert, T. Keller (University of Basel) Foundations of Artificial Intelligence

27. Constraint Satisfaction Problems: Constraint Graphs

### Trees as Constraint Graphs

### Proposition (trees as constraint graphs)

Let C be a constraint network with n variables and maximal domain size k whose constraint graph is a tree or forest (i.e., does not contain cycles).

Then we can solve C or prove that no solution exists in time  $O(nk^2)$ .

example: 
$$k = 5, n = 10$$
  
 $\sim k^n = 9765625, nk^2 = 250$ 

M. Helmert, T. Keller (University of Basel) Foundations of Artificial Intelligence

27. Constraint Satisfaction Problems: Constraint Graphs

### Trees as Constraint Graphs: Algorithm

#### algorithm for trees:

- ▶ Build a directed tree for the constraint graph. Select an arbitrary variable as the root.
- $\triangleright$  Order variables  $v_1, \ldots, v_n$  such that parents are ordered before their children.
- ► For  $i \in \langle n, n-1, \ldots, 2 \rangle$ : call revise $(v_{parent(i)}, v_i)$ → each variable is arc consistent with respect to its children
- ▶ If a domain becomes empty, the problem is unsolvable.
- ► Otherwise: solve with BacktrackingWithInference, variable order  $v_1, \ldots, v_n$  and forward checking. → solution is found without backtracking steps

proof: → exercises

M. Helmert, T. Keller (University of Basel)

27. Constraint Satisfaction Problems: Constraint Graphs

### Trees as Constraint Graphs: Example

constraint network → directed tree + order:

#### revise steps:

- $\triangleright$  revise(D, F)
- $\triangleright$  revise(D, E)
- $\triangleright$  revise(B, D)
- ▶ revise(B, C)
- ▶ revise(A, B)

#### finding a solution:

backtracking with order  $A \prec B \prec C \prec D \prec E \prec F$ 

M. Helmert, T. Keller (University of Basel)

27. Constraint Satisfaction Problems: Constraint Graphs

# 27.4 Summary

27. Constraint Satisfaction Problems: Constraint Graphs

# Summary

- ► Constraint networks with simple structure are easy to solve.
- ► Constraint graphs formalize this structure:
  - several connected components: solve separately for each component
  - tree: algorithm linear in number of variables
