Propositional Logic: Motivation

- ▶ Propositional logic allows for the representation of knowledge and for deriving conclusions based on this knowledge.
- many practical applications can be directly encoded, e.g.
 - constraint satisfaction problems of all kinds
 - circuit design and verification
- many problems contain logic as ingredient, e.g.
 - automated planning
 - general game playing
 - description logic queries (semantic web)

31. Propositional Logic: DPLL Algorithm

Propositional Logic: Algorithmic Problems

main problems:

 \blacktriangleright reasoning ($\Theta \models \varphi$?): Does the formula φ logically follow from the formulas Θ ?

ightharpoonup equivalence ($\varphi \equiv \psi$): Are the formulas φ and ψ logically equivalent?

► satisfiability (SAT): Is formula φ satisfiable? If yes, find a model.

German: Schlussfolgern, Äquivalenz, Erfüllbarkeit

31. Propositional Logic: DPLL Algorithm

The Satisfiability Problem

The Satisfiability Problem (SAT)

given:

propositional formula in conjunctive normal form (CNF) usually represented as pair $\langle V, \Delta \rangle$:

- V set of propositional variables (propositions)
- \triangleright \triangle set of clauses over V(clause = set of literals v or $\neg v$ with $v \in V$)

find:

- satisfying interpretation (model)
- or proof that no model exists

SAT is a famous NP-complete problem (Cook 1971; Levin 1973).

31. Propositional Logic: DPLL Algorithm

Relevance of SAT

- ► The name "SAT" is often used for the satisfiability problem for general propositional formulas (instead of restriction to CNF).
- General SAT can be reduced to CNF (conversion in time O(n)).
- ▶ All previously mentioned problems can be reduced to SAT (conversion in time O(n)).
- → SAT algorithms important and intensively studied

this and next chapter: SAT algorithms

31.2 Systematic Search: DPLL

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 27, 2022 9

SAT can be considered as constraint satisfaction problem:

- ► CSP variables = propositions
- ▶ domains = $\{F, T\}$
- constraints = clauses

However, we often have constraints that affect > 2 variables.

Due to this relationship, all ideas for CSPs are applicable to SAT:

- search
- inference
- variable and value orders

31. Propositional Logic: DPLL Algorithm

Systematic Search: DPLL

The DPLL Algorithm

The DPLL algorithm (Davis/Putnam/Logemann/Loveland) corresponds to backtracking with inference for CSPs.

- recursive call DPLL(Δ , I) for clause set Δ and partial interpretation I
- result is consistent extension of *I*; unsatisfiable if no such extension exists
- ▶ first call $DPLL(\Delta, \emptyset)$

inference in DPLL:

- simplify: after assigning value d to variable v, simplify all clauses that contain v → forward checking (for constraints of potentially higher arity)
- unit propagation: variables that occur in clauses without other variables (unit clauses) are assigned immediately
 - → minimum remaining values variable order

31. Propositional Logic: DPLL Algorithm

Systematic Search: DPLL

The DPLL Algorithm: Pseudo-Code

```
function DPLL(\Delta, I):
if \square \in \Delta:
                                             [empty clause exists \infty unsatisfiable]
      return unsatisfiable
else if \Delta = \emptyset:
                          [no clauses left \rightsquigarrow interpretation / satisfies formula]
      return /
else if there exists a unit clause \{v\} or \{\neg v\} in \Delta: [unit propagation]
     Let v be such a variable, d the truth value that satisfies the clause.
      \Delta' := simplify(\Delta, v, d)
     return DPLL(\Delta', I \cup \{v \mapsto d\})
                                                                         splitting rule
else:
      Select some variable v which occurs in \Delta.
      for each d \in \{F, T\} in some order:
            \Delta' := simplify(\Delta, v, d)
           I' := \mathsf{DPLL}(\Delta', I \cup \{v \mapsto d\})
           if I' \neq unsatisfiable
                 return /
      return unsatisfiable
```

Systematic Search: DPLL

The DPLL Algorithm: simplify

function simplify(Δ , v, d)

Let ℓ be the literal for v that is satisfied by $v \mapsto d$.

 $\Delta' := \{C \mid C \in \Delta \text{ such that } \ell \notin C\}$

 $\Delta'' := \{ C \setminus \{ \bar{\ell} \} \mid C \in \Delta' \}$

return Δ''

31. Propositional Logic: DPLL Algorithm

Systematic Search: DPLL

Example (1)

$$\Delta = \{ \{X, Y, \neg Z\}, \{\neg X, \neg Y\}, \{Z\}, \{X, \neg Y\} \}$$

- unit propagation: $Z \mapsto T$ $\{\{X,Y\},\{\neg X,\neg Y\},\{X,\neg Y\}\}$
- splitting rule:
- 2a. $X \mapsto \mathbf{F}$ $\{\{Y\}, \{\neg Y\}\}$
- $\{\{\neg Y\}\}$

2b. $X \mapsto \mathbf{T}$

- 3a. unit propagation: $Y \mapsto T$ 3b. unit propagation: $Y \mapsto F$ $\{\Box\}$

Foundations of Artificial Intelligence

April 27, 2022 14 / 22

31. Propositional Logic: DPLL Algorithm

Systematic Search: DPLL

Example (2)

$$\Delta = \{\{W, \neg X, \neg Y, \neg Z\}, \{X, \neg Z\}, \{Y, \neg Z\}, \{Z\}\}\}$$

- unit propagation: $Z \mapsto T$ $\{\{W, \neg X, \neg Y\}, \{X\}, \{Y\}\}\}$
- \bigcirc unit propagation: $X \mapsto T$ $\{\{W, \neg Y\}, \{Y\}\}$
- \bigcirc unit propagation: $Y \mapsto T$ {{*W*}}
- 4 unit propagation: $W \mapsto T$

31. Propositional Logic: DPLL Algorithm

Systematic Search: DPLL

Properties of DPLL

- ▶ DPLL is sound and complete.
- ▶ DPLL computes a model if a model exists.
 - Some variables possibly remain unassigned in the solution *I*; their values can be chosen arbitrarily.
- time complexity in general exponential
- → important in practice: good variable order and additional inference methods (in particular clause learning)
- ▶ Best known SAT algorithms are based on DPLL.

DPLL on Horn Formulas

DPLL on Horn Formulas

Horn Formulas

31. Propositional Logic: DPLL Algorithm

important special case: Horn formulas

Definition (Horn formula)

A Horn clause is a clause with at most one positive literal, i.e., of the form

$$\neg x_1 \lor \cdots \lor \neg x_n \lor y \text{ or } \neg x_1 \lor \cdots \lor \neg x_n$$

(n = 0 is allowed.)

A Horn formula is a propositional formula in conjunctive normal form that only consists of Horn clauses.

German: Hornformel

- ► foundation of logic programming (e.g., PROLOG)
- critical in many kinds of practical reasoning problems

31. Propositional Logic: DPLL Algorithm

DPLL on Horn Formulas

DPLL on Horn Formulas

Proposition (DPLL on Horn formulas)

If the input formula φ is a Horn formula, then the time complexity of DPLL is polynomial in the length of φ .

Proof. properties:

• If Δ is a Horn formula, then so is simplify (Δ, v, d) . (Why?)

- → all formulas encountered during DPLL search are Horn formulas if input is Horn formula
- 2 Every Horn formula without empty or unit clauses is satisfiable:
 - ▶ all such clauses consist of at least two literals
 - ► Horn property: at least one of them is negative
 - assigning F to all variables satisfies formula

31. Propositional Logic: DPLL Algorithm

DPLL on Horn Formulas

DPLL on Horn Formulas (Continued)

Proof (continued).

- From 2. we can conclude:
 - if splitting rule applied, then current formula satisfiable, and
 - if a wrong decision is taken, then this will be recognized without applying further splitting rules (i.e., only by applying unit propagation and by deriving the empty clause).
- Hence the generated search tree for *n* variables can only contain at most n nodes where the splitting rule is applied (i.e., where the tree branches).
- 1 It follows that the search tree is of polynomial size. and hence the runtime is polynomial.

31. Propositional Logic: DPLL Algorithm

Summary

- satisfiability basic problem in propositional logic to which other problems can be reduced
- ► here: satisfiability for CNF formulas
- ▶ Davis-Putnam-Logemann-Loveland procedure (DPLL): systematic backtracking search with unit propagation as inference method
- ▶ DPLL successful in practice, in particular when combined with other ideas such as clause learning
- polynomial on Horn formulas(= at most one positive literal per clause)
