May 2, 2022

Classification

classification:

Automated Planning
environment:
- ▶ **static** vs. dynamic
- ▶ **deterministic** vs. non-deterministic vs. stochastic
- ▶ **fully** vs. partially vs. not **observable**
- ▶ **discrete** vs. continuous
- ▶ **single-agent** vs. multi-agent

problem solving method:
- ▶ problem-specific vs. **general** vs. learning

33.1 Introduction

Automated Planning

> **What is Automated Planning?**
> "Planning is the art and practice of thinking before acting."
> — P. Haslum

⤳ finding **plans** (sequences of actions)
that lead from an initial state to a goal state

our topic in this course: **classical planning**

- ▶ **general** approach to finding solutions
  for **state-space search problems** (Chapters 5–19)
- ▶ **classical** = static, deterministic, fully observable
- ▶ **variants:** probabilistic planning, planning under partial
  observability, online planning, . . .

Planning: Informally

given:

- ▶ state space description in terms of suitable problem
  description language (**planning formalism**)

required:

- ▶ a **plan**, i.e., a solution for the described state space
  (sequence of actions from initial state to goal)
- ▶ or a proof that no plan exists

distinguish between

- ▶ **optimal planning**: guarantee that returned plans
  are optimal, i.e., have minimal overall cost
- ▶ **suboptimal planning** (**satisficing**):
  suboptimal plans are allowed

What is New?

Many previously encountered problems are planning tasks:

- ▶ blocks world
- ▶ missionaries and cannibals
- ▶ 15-puzzle

New: we are now interested in **general** algorithms, i.e.,
the developer of the search algorithm **does not know**
the tasks that the algorithm needs to solve.

- ⤳ no problem-specific heuristics!
- ⤳ **input language** to model the planning task

Automated Planning: Overview

Chapter overview: automated planning

- ▶ 33. Introduction
- ▶ 34. Planning Formalisms
- ▶ 35.–36. Planning Heuristics: Delete Relaxation
- ▶ 37. Planning Heuristics: Abstraction
- ▶ 38.–39. Planning Heuristics: Landmarks

33.2 Repetition: State Spaces

About This Section

Nothing New Here!

This section is a repetition of Section 5.2
of the chapter "State-Space Search: State Spaces".

Formalization of State Spaces

preliminary remarks:

- to cleanly study search problems we need a formal model
- fundamental concept: state spaces
- state spaces are (labeled, directed) graphs
- paths to goal states represent solutions
- shortest paths correspond to optimal solutions

State Spaces

Definition (state space)

A state space or transition system is a 6-tuple
$\mathcal{S} = \langle S, A, cost, T, s_0, S_\star \rangle$ with

- S: finite set of states
- A: finite set of actions
- $cost : A \to \mathbb{R}_0^+$ action costs
- $T \subseteq S \times A \times S$ transition relation; deterministic in $\langle s, a \rangle$ (see next slide)
- $s_0 \in S$ initial state
- $S_\star \subseteq S$ set of goal states

German: Zustandsraum, Transitionssystem, Zustände, Aktionen, Aktionskosten, Transitions-/Übergangsrelation, deterministisch, Anfangszustand, Zielzustände

State Spaces: Transitions, Determinism

Definition (transition, deterministic)

Let $\mathcal{S} = \langle S, A, cost, T, s_0, S_\star \rangle$ be a state space.

The triples $\langle s, a, s' \rangle \in T$ are called (state) transitions.

We say $\mathcal{S}$ has the transition $\langle s, a, s' \rangle$ if $\langle s, a, s' \rangle \in T$.
We write this as $s \xrightarrow{a} s'$, or $s \rightarrow s'$ when a does not matter.

Transitions are deterministic in $\langle s, a \rangle$: it is forbidden to have both $s \xrightarrow{a} s_1$ and $s \xrightarrow{a} s_2$ with $s_1 \neq s_2$.

State Spaces: Terminology

terminology:

- ▶ predecessor, successor
- ▶ applicable action
- ▶ path, length, costs
- ▶ reachable
- ▶ solution, optimal solution

German: Vorgänger, Nachfolger, anwendbare Aktion, Pfad, Länge, Kosten, erreichbar, Lösung, optimale Lösung

33.3 Compact Descriptions

State Spaces with Declarative Representations

How do we represent state spaces in the computer?

previously: as black box

now: as declarative description

reminder: Chapter 6

State Spaces with Declarative Representations

represent state spaces declaratively:

- ▶ compact description of state space as input to algorithms
  ⤳ state spaces exponentially larger than the input
- ▶ algorithms directly operate on compact description
- ⤳ allows automatic reasoning about problem: reformulation, simplification, abstraction, etc.

Reminder: Blocks World
problem: n blocks ⤳ more than $n!$ states

Compact Description of State Spaces

How to describe state spaces compactly?

Compact Description of Several States
- ▶ introduce state variables
- ▶ states: assignments to state variables
- ⤳ e.g., n binary state variables can describe 2^n states
- ▶ transitions and goal are compactly described with a logic-based formalism

different variants: different planning formalisms

33.4 Summary

Summary

- ▶ planning: search in general state spaces
- ▶ input: compact, declarative description of state space
