#### Constraint Satisfaction Problems: Overview

Chapter overview: constraint satisfaction problems

- ▶ 22.–23. Introduction
- ▶ 24.–26. Basic Algorithms
- ▶ 27.–28. Problem Structure
  - ▶ 27. Constraint Graphs
  - ▶ 28. Decomposition Methods

28. Constraint Satisfaction Problems: , Decomposition Methods

Decomposition Methods

# 28.1 Decomposition Methods

28. Constraint Satisfaction Problems: , Decomposition Methods

## More Complex Graphs

What if the constraint graph is not a tree and does not decompose into several components?

▶ idea 1: conditioning

▶ idea 2: tree decomposition

28.2 Conditioning

April 19, 2023

28. Constraint Satisfaction Problems: , Decomposition Methods

## Conditioning

#### Conditioning

idea: Apply backtracking with forward checking until the constraint graph restricted to the remaining unassigned variables decomposes or is a tree.

remaining problem  $\rightsquigarrow$  algorithms for simple constraint graphs

### cutset conditioning:

Choose variable order such that early variables form a small cutset (i.e., set of variables such that removing these variables results in an acyclic constraint graph).

time complexity: n variables, m < n in cutset, maximal domain size k:  $O(k^m \cdot (n-m)k^2)$ 

(Finding optimal cutsets is an NP-complete problem.)

28. Constraint Satisfaction Problems: , Decomposition Methods

## Conditioning: Example

Australia example: Cutset of size 1 suffices:

## Tree Decomposition

28. Constraint Satisfaction Problems: , Decomposition Methods

#### basic idea of tree decomposition:

- ▶ Decompose constraint network into smaller subproblems (overlapping).
- Find solutions for the subproblems.
- Build overall solution based on the subsolutions.

#### more details:

- "Overall solution building problem" based on subsolutions is a constraint network itself (meta constraint network).
- ► Choose subproblems in a way that the constraint graph of the meta constraint network is a tree/forest.
  - → build overall solution with efficient tree algorithm

28. Constraint Satisfaction Problems: , Decomposition Methods

## Tree Decomposition: Example

#### constraint network:

## tree decomposition:

- $\triangleright$  Every vertex of  $\mathcal{T}$  corresponds to a subset of the variables V. Such a vertex (and corresponding variable set) is called a subproblem of C.
- For every nontrivial constraint  $R_{uv}$  of C, the variables u and vappear together in at least one subproblem in  $\mathcal{T}$ .

28.3 Tree Decomposition

28. Constraint Satisfaction Problems: , Decomposition Methods

## Tree Decomposition: Definition

#### Definition (tree decomposition)

Consider a constraint network C with variables V.

A tree decomposition of C

is a graph  $\mathcal T$  with the following properties.

#### requirements on vertices:

Keller & F. Pommerening (University of B Foundations of Artificial Intelligence

## Tree Decomposition: Definition

#### Definition (tree decomposition)

Consider a constraint network C with variables V.

A tree decomposition of C

is a graph  ${\mathcal T}$  with the following properties.

#### requirements on edges:

- ▶ For each variable  $v \in V$ , let  $T_v$  be the set of vertices corresponding to the subproblems that contain v.
- ▶ For each variable v, the set  $T_v$  is connected, i.e., each vertex in  $\mathcal{T}_{\nu}$  is reachable from every other vertex in  $\mathcal{T}_{\nu}$  without visiting vertices not contained in  $\mathcal{T}_{\nu}$ .
- T is acyclic (a tree/forest)

Keller & F. Pommerening (University of B Foundations of Artificial Intelligence

April 19, 2023

Keller & F. Pommerening (University of B Foundations of Artificial Intelligence

 $V^{\mathcal{T}}$ := vertices of  $\mathcal{T}$  (i.e., subproblems of  $\mathcal{C}$  occurring in  $\mathcal{T}$ )

 $ightharpoonup R_{uv}^{\mathcal{T}} := \{ \langle s, t \rangle \mid s, t \text{ compatible solutions of subproblems } u, v \}$ 

subproblems not connected by an edge of  $\mathcal{T}$  are trivial.)

if  $\{u, v\}$  is an edge of  $\mathcal{T}$ . (All constraints between

## Solving with Tree Decompositions: Algorithm

### algorithm:

- Find all solutions for all subproblems in the decomposition and build a tree-like meta constraint network.
- Constraints in meta constraint network: subsolutions must be compatible.
- Solve meta constraint network with an algorithm for tree-like networks.

28. Constraint Satisfaction Problems: , Decomposition Methods

Good Tree Decompositions

28. Constraint Satisfaction Problems: , Decomposition Methods

based on tree decomposition  $\mathcal{T}$ 

Meta Constraint Network

goal: each subproblem has as few variables as possible

meta constraint network  $\mathcal{C}^{\mathcal{T}} = \langle V^{\mathcal{T}}, \mathsf{dom}^{\mathcal{T}}, (R_{uv}^{\mathcal{T}}) \rangle$ 

 $ightharpoonup dom^{\mathcal{T}}(v) := \text{set of solutions of subproblem } v$ 

Solutions of two subproblems are called compatible

if all overlapping variables are assigned identically.

- $\triangleright$  crucial: subproblem V' in  $\mathcal{T}$  with highest number of variables
- ightharpoonup number of variables in V' minus 1 is called width of the decomposition
- best width over all decompositions: tree width of the constraint graph (computation is NP-complete)

time complexity of solving algorithm based on tree decompositions:  $O(nk^{w+1})$ , where w is width of decomposition (requires specialized version of revise; otherwise  $O(nk^{2w+2})$ .)

28.4 Summary

Keller & F. Pommerening (University of B Foundations of Artificial Intelligence

April 19, 2023

28. Constraint Satisfaction Problems: , Decomposition Methods

## Summary: This Chapter

- ▶ Reduce complex constraint graphs to simple constraint graphs.
- cutset conditioning:
  - ► Choose as few variables as possible (cutset) such that an assignment to these variables yields a remaining problem which is structurally simple.
  - search over assignments of variables in cutset
- ▶ tree decomposition: build tree-like meta constraint network
  - meta variables: groups of original variables that jointly cover all variables and constraints
  - values correspond to consistent assignments to the groups
  - constraints between overlapping groups to ensure compatibility
  - overall algorithm exponential in width of decomposition (size of largest group)

## Summary: CSPs

#### Constraint Satisfaction Problems (CSP)

General formalism for problems where

- values have to be assigned to variables
- > such that the given constraints are satisfied.
- ▶ algorithms: backtracking search + inference (e.g., forward checking, arc consistency, path consistency)
- variable and value orders important
- ▶ more efficient: exploit structure of constraint graph (connected components; trees)

28. Constraint Satisfaction Problems: , Decomposition Methods

## More Advanced Topics

#### more advanced topics (not considered in this course):

- **backjumping**: backtracking over several layers
- ▶ no-good learning: infer additional constraints based on information collected during backtracking
- local search methods in the space of total, but not necessarily consistent assignments
- tractable constraint classes: identification of constraint types that allow for polynomial algorithms
- solutions of different quality: constraint optimization problems (COP)

→ more than enough content for a one-semester course
