C1.6 Summary

C1.1 Heuristics

Planning as Heuristic Search

- ▶ **Heuristic search** is the most common approach to planning.
- ▶ ingredients: **general search algorithm** + **heuristic**
- ▶ heuristic estimates cost from a given state to a given goal
 - ▶ **progression**: from varying states s to fixed goal γ
 - ▶ **regression**: from fixed initial state l to varying subgoals φ
- ▶ Over the next weeks, we study the main ideas behind heuristics for planning tasks.

Reminder: Heuristics

Need to Catch Up?

- ▶ We assume familiarity with heuristics and their properties:
 - ▶ **heuristic** $h : S \rightarrow \mathbb{R}_0^+ \cup \{\infty\}$
 - ▶ **perfect heuristic** h^* : $h^*(s)$ cost of optimal solution from s (∞ if unsolvable)
 - ▶ properties of heuristics h :
 - ▶ **safe**: $(h(s) = \infty \Rightarrow h^*(s) = \infty)$ for all states s
 - ▶ **goal-aware**: $h(s) = 0$ for all goal states s
 - ▶ **admissible**: $h(s) \leq h^*(s)$ for all states s
 - ▶ **consistent**: $h(s) \leq \text{cost}(o) + h(s')$ for all transitions $s \xrightarrow{o} s'$
 - ▶ connections between these properties
- ▶ If you are not familiar with these topics, we recommend Chapters 13–14 of the [Foundations of Artificial Intelligence](http://informatik.unibas.ch/fs2016/grundlagen-der-kuenstlichen-intelligenz/) course at <http://informatik.unibas.ch/fs2016/grundlagen-der-kuenstlichen-intelligenz/>.

C1.2 Coming Up with Heuristics

A Simple Heuristic for Planning Tasks

STRIPS (Fikes & Nilsson, 1971) used the number of state variables that differ in current state s and a STRIPS goal $v_1 \wedge \dots \wedge v_n$:

$$h(s) := |\{i \in \{1, \dots, n\} \mid s \not\models v_i\}|.$$

Intuition: more satisfied goal atoms \rightsquigarrow closer to the goal

\rightsquigarrow **STRIPS heuristic (a.k.a. goal-count heuristic)** (properties?)

Criticism of the STRIPS Heuristic

What is wrong with the STRIPS heuristic?

- ▶ quite **uninformative**:
 - the range of heuristic values in a given task is small;
 - typically, most successors have the same estimate
 - ▶ very sensitive to **reformulation**:
 - can easily transform any planning task into an equivalent one where $h(s) = 1$ for all non-goal states (how?)
 - ▶ ignores almost all **problem structure**:
 - heuristic value does not depend on the set of operators!
- \rightsquigarrow need a better, principled way of coming up with heuristics

Coming Up with Heuristics in a Principled Way

General Procedure for Obtaining a Heuristic

- ▶ **Simplify the problem**, for example by removing problem constraints.
- ▶ Solve the simplified problem (ideally optimally).
- ▶ Use the solution cost for the simplified problem as a heuristic for the real problem.

As heuristics are computed for every generated search state, it is important that they can be computed **efficiently**.

Relaxing a Problem: Example

Example (Route Planning in a Road Network)

The road network is formalized as a weighted graph over points in the Euclidean plane. The weight of an edge is the **road distance** between two locations.

Example (Relaxation for Route Planning)

Use the **Euclidean distance** $\sqrt{|x_1 - x_2|^2 + |y_1 - y_2|^2}$ as a heuristic for the road distance between $\langle x_1, y_1 \rangle$ and $\langle x_2, y_2 \rangle$. This is a **lower bound** on the road distance (\rightsquigarrow admissible).

\rightsquigarrow We drop the constraint of having to travel on roads.

Planning Heuristics: Main Concepts

Major ideas for heuristics in the planning literature:

- ▶ delete relaxation
- ▶ abstraction
- ▶ landmarks
- ▶ critical paths
- ▶ network flows

We will consider all of them in this course, beginning with **delete relaxation**.

C1.3 Relaxed Planning Tasks

Delete Relaxation: Idea

In **positive normal form** (Chapter A6, remember?), good and bad effects are easy to distinguish:

- ▶ Effects that make state variables true are good (**add effects**).
- ▶ Effects that make state variables false are bad (**delete effects**).

Idea of **delete relaxation heuristics**: ignore all delete effects.

Delete-Relaxed Planning Tasks

Definition (Delete Relaxation of Operators)

The **delete relaxation** o^+ of an operator o in positive normal form is the operator obtained by replacing all negative effects $\neg a$ within $\text{eff}(o)$ by the do-nothing effect \top .

Definition (Delete Relaxation of Planning Tasks)

The **delete relaxation** Π^+ of a planning task $\Pi = \langle V, I, O, \gamma \rangle$ in positive normal form is the planning task $\Pi^+ := \langle V, I, \{o^+ \mid o \in O\}, \gamma \rangle$.

Definition (Delete Relaxation of Operator Sequences)

The **delete relaxation** of an operator sequence $\pi = \langle o_1, \dots, o_n \rangle$ is the operator sequence $\pi^+ := \langle o_1^+, \dots, o_n^+ \rangle$.

Note: “delete” is often omitted: **relaxation**, **relaxed**

Relaxed Planning Tasks: Terminology

- ▶ Planning tasks in positive normal form without delete effects are called **relaxed planning tasks**.
- ▶ Plans for relaxed planning tasks are called **relaxed plans**.
- ▶ If Π is a planning task in positive normal form and π^+ is a plan for Π^+ , then π^+ is called a **relaxed plan for Π** .

C1.4 The Domination Lemma

On-Set and Dominating States

Definition (On-Set)

The **on-set** of a valuation s is the set of propositional variables that are true in s , i.e., $on(s) = s^{-1}(\{\mathbf{T}\})$.

\rightsquigarrow for **states**: states can be viewed as **sets** of (true) state variables

Definition (Dominate)

A valuation s' **dominates** a valuation s if $on(s) \subseteq on(s')$.

\rightsquigarrow all state variables true in s are also true in s'

Domination Lemma (1)

Lemma (Domination)

Let s and s' be valuations of a set of propositional variables V , and let χ be a propositional formula over V which does not contain negation symbols.

If $s \models \chi$ and s' dominates s , then $s' \models \chi$.

Proof.

Proof by induction over the structure of χ .

- ▶ Base case $\chi = \top$: then $s' \models \top$.
- ▶ Base case $\chi = \perp$: then $s \not\models \perp$.

...

Domination Lemma (2)

Proof (continued).

- ▶ Base case $\chi = v \in V$: if $s \models v$, then $v \in on(s)$.
With $on(s) \subseteq on(s')$, we get $v \in on(s')$ and hence $s' \models v$.
- ▶ Inductive case $\chi = \chi_1 \wedge \chi_2$: by induction hypothesis, our claim holds for the proper subformulas χ_1 and χ_2 of χ .

$$\begin{aligned}
 s \models \chi &\implies s \models \chi_1 \wedge \chi_2 \\
 &\implies s \models \chi_1 \text{ and } s \models \chi_2 \\
 \text{I.H. (twice)} &\implies s' \models \chi_1 \text{ and } s' \models \chi_2 \\
 &\implies s' \models \chi_1 \wedge \chi_2 \\
 &\implies s' \models \chi.
 \end{aligned}$$

- ▶ Inductive case $\chi = \chi_1 \vee \chi_2$: analogous

□

C1.5 The Relaxation Lemma

Add Sets and Delete Sets

Definition (Add Set and Delete Set for an Effect)

For all effects e and states s over state variables V , the **add set** of e in s , written $[e]_s^+$, and the **delete set** of e in s , written $[e]_s^-$, are defined as the following sets of state variables:

$$[e]_s^+ = \{v \in V \mid v \in [e]_s\}$$

$$[e]_s^- = \{v \in V \mid \neg v \in [e]_s\}$$

Note: For all states s and operators o applicable in s , we have $on(s[[o]]) = (on(s) \setminus [eff(o)]_s^-) \cup [eff(o)]_s^+$.

Relaxation Lemma

For this and the following chapters on delete relaxation, we always assume tasks are in positive normal form.

Lemma (Relaxation)

Let s be a state, let s' be a state that dominates s , and let π be an operator sequence which is applicable in s .

Then π^+ is applicable in s' and $s'[[\pi^+]]$ dominates $s[[\pi]]$. Moreover, if π leads to a goal state from s , then π^+ leads to a goal state from s' .

Proof of Relaxation Lemma (1)

Proof.

The “moreover” part follows from the rest by the domination lemma. Prove the rest by induction over the length of π .

Base case: $\pi = \langle \rangle$

$s'[[\pi^+]] = s'$ dominates $s[[\pi]] = s$ by prerequisite.

Inductive case: $\pi = \langle o_1, \dots, o_{n+1} \rangle$

By the induction hypothesis, $\langle o_1^+, \dots, o_n^+ \rangle$ is applicable in s' , and $t' = s'[[\langle o_1^+, \dots, o_n^+ \rangle]]$ dominates $t = s[[\langle o_1, \dots, o_n \rangle]]$.

o_{n+1} is applicable in t , and thus $t \models pre(o_{n+1})$.

By the domination lemma, we get $t' \models pre(o_{n+1})$ and hence o_{n+1}^+ is applicable in t' . Therefore, π^+ is applicable in s' .

Because o_{n+1} is in positive normal form, all effect conditions satisfied by t are also satisfied by t' (by the domination lemma).

Therefore, $[eff(o_{n+1})]_t^+ \subseteq [eff(o_{n+1}^+)]_{t'}$

Proof of Relaxation Lemma (2)

Proof (continued).

We get:

$$\begin{aligned} on(s[[\pi]]) &= (on(t) \setminus [eff(o_{n+1})]_t^-) \cup [eff(o_{n+1})]_t^+ \\ &\subseteq on(t) \cup [eff(o_{n+1})]_t^+ \\ &\subseteq on(t') \cup [eff(o_{n+1}^+)]_{t'} \\ &= on(s'[[\pi^+]]), \end{aligned}$$

and thus $s'[[\pi^+]]$ dominates $s[[\pi]]$. □

Consequences of the Relaxation Lemma (1)

Corollary (Relaxation Preserves Plans and Leads to Dominance)

Let π be an operator sequence that is applicable in state s .

Then π^+ is applicable in s and $s[\pi^+]$ dominates $s[\pi]$.

If π is a plan for Π , then π^+ is a plan for Π^+ .

Proof.

Apply relaxation lemma with $s' = s$. □

- ↪ Relaxations of plans are relaxed plans.
- ↪ Delete relaxation is no harder to solve than original task.
- ↪ Optimal relaxed plans are never more expensive than optimal plans for original tasks.

Consequences of the Relaxation Lemma (2)

Corollary (Relaxation Preserves Dominance)

Let s be a state, let s' be a state that dominates s ,

and let π^+ be a relaxed operator sequence applicable in s .

Then π^+ is applicable in s' and $s'[\pi^+]$ dominates $s[\pi^+]$.

Proof.

Apply relaxation lemma with π^+ for π ,
noting that $(\pi^+)^+ = \pi^+$. □

- ↪ If there is a relaxed plan starting from state s , the same plan can be used starting from a dominating state s' .
- ↪ Dominating states are always “better” in relaxed planning tasks.

C1.6 Summary

Summary

- ▶ A general way to come up with heuristics: solve a **simplified** version of the real problem, for example by removing problem constraints.
- ▶ **delete relaxation**: given a task in positive normal form, discard all delete effects
- ▶ Delete relaxation is a **simplification** in the sense that it is never harder to solve a relaxed task than the original one.
- ▶ Delete-relaxed tasks have a **domination** property: it is always beneficial to make more state variables true.
