# Planning and Optimization

September 26, 2016 — X1. Hands-On and Repetition

## X1.1 PDDL

## X1.2 Getting to Know a Planner

## X1.3 Hands-On

## Introduction

### Hands-On: Outline for this week

Working with an existing planning system (Fast Downward).

- ▶ Domain modeling
- ▶ Recognizing the difference: blind vs. informed planning
- ▶ Implementation in Fast Downward

## Hands-On: Overview

### Chapter overview: hands-on

- ▶ 1. The Planning Domain Definition Language (PDDL)
- ▶ 2. Getting to Know a Planner
- ▶ 3. Heuristics
- ▶ 4. A\* search algorithm

# X1.1 PDDL

## Representation of State Spaces

### Representation of State Spaces

- ▶ explicit graphs
- ▶ black box
- ▶ **declarative representations**

### In this Course: Declarative Representations

- ▶ **compact** description of state space as input to algorithms  
 ~> state space **exponentially larger** than input
- ▶ algorithms operate directly on compact description
- ~> allows automatic reasoning about problem (abstractions etc.)

## Representation of State Spaces

### PDDL: Planning Domain Definition Language

- ▶ PDDL is the standard language used in practice to describe planning tasks.
- ▶ descriptions in (restricted) predicate logic instead of propositional logic (~> even more compact)
- ▶ There exist defined PDDL fragments for STRIPS and ADL; many planners only support the STRIPS fragment.
- ▶ In this week: restriction to STRIPS

## Illustrating Example: 15-Puzzle

# 15-Puzzle in PDDL

Example: 15-Puzzle in PDDL

# X1.2 Getting to Know a Planner

# Planner: Fast Downward

## Fast Downward

We use the **Fast Downward** planner in this course

- ▶ because we know it well (developed by our research group)
- ▶ because it implements many search algorithms and heuristics
- ▶ because it is the classical planner most commonly used as a basis for other planners these days

↪ <http://www.fast-downward.org>

# Solving the 15-Puzzle

## Demo

```
$ ./fast-downward \  
  tile/puzzle.pddl tile/puzzle01.pddl \  
  --heuristic "h=ff()" \  
  --search "eager_greedy(h)"
```

# X1.3 Hands-On
