

Planning and Optimization

X2. Hands-On and Repetition

Florian Pommerening

Universität Basel

September 27, 2017

Hands-On: Overview

Chapter overview: hands-on

- 1. The Planning Domain Definition Language (PDDL)
- 2. Getting to Know a Planner
- 3. Heuristics
- 4. A* search algorithm

Heuristics

Heuristics

Definition (heuristic)

Let \mathcal{S} be a state space with set of states S .

A **heuristic function** or **heuristic** for \mathcal{S} is a function

$$h : S \rightarrow \mathbb{R}_0^+ \cup \{\infty\},$$

mapping each state to a non-negative number (or ∞).

Heuristics: Intuition

idea: $h(s)$ estimates cost of cheapest path
from s to closest goal state

- heuristics can be **arbitrary** functions
- **intuition:** the closer h is to true cost to goal,
the more efficient the search using h

A* Search Algorithm

A* Search Algorithm

A* search algorithm

- based on heuristic h , define evaluation function f for node n :
 $f(n) := g(n) + h(n.state)$
- trade-off between path cost and estimated proximity to goal
- intuition: $f(n)$ estimates costs of cheapest solution from initial state through $n.state$ to goal

A* Search Algorithm: Pseudo-Code

A* search algorithm (with re-opening)

```
open := new priority queue, ordered by  $\langle f, h \rangle$ 
if  $h(\text{init-state}) < \infty$ :
    open.insert(make_root_node())
distances := new HashTable
while not open.empty():
    n = open.pop-min()
    if (not distances.contains(n.state)) or ( $g(n) < \text{distances}[n.state]$ ):
        distances[n.state] :=  $g(n)$ 
        if is-goal(n.state):
            return extract-solution(n)
        for each successor  $\langle a, s' \rangle$  of n.state:
            if  $h(s') < \infty$ :
                 $n' := \text{make\_node}(n, a, s')$ 
                open.insert( $n'$ )
return unsolvable
```

A* Search Algorithm

Most important property

- A* is **optimal** if the applied heuristic is **admissible**.

For more details on best-first search and A*, see chapter 15–19 of the AI course last semester.

(<http://informatik.unibas.ch/fs2017/foundations-of-artificial-intelligence>)

Example: A* for Route Planning

Example heuristic: straight-line distance to Bucharest

Arad	366
Bucharest	0
Craiova	160
Drobeta	242
Eforie	161
Fagaras	176
Giurgiu	77
Hirsova	151
Iasi	226
Lugoj	244
Mehadia	241
Neamt	234
Oradea	380
Pitesti	100
Rimnicu Vilcea	193
Sibiu	253
Timisoara	329
Urziceni	80
Vaslui	199
Zerind	374

Example: A* for Route Planning

(a) The initial state

Example: A* for Route Planning

(a) The initial state

(b) After expanding Arad

Example: A* for Route Planning

(a) The initial state

(b) After expanding Arad

(c) After expanding Sibiu

Example: A* for Route Planning

(a) The initial state

(b) After expanding Arad

(c) After expanding Sibiu

(d) After expanding Rimnicu Vilcea

Example: A* for Route Planning

(e) After expanding Fagaras

Example: A* for Route Planning

(e) After expanding Fagaras

(f) After expanding Pitesti

Hands-On

Hands-On

clone the course repository

```
hg clone https://bitbucket.org/aibasel/planopt-hs17
```

update the course repository

```
cd planopt-hs17  
hg pull -u
```

compile the planner

```
cd hands-on-2/fast-downward  
./build.py
```

work on the hands-on exercises

- implement A* search
- compare to built-in implementation
