20. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Introduction

previous chapters: classical state-space search

- find action sequence (path) from initial to goal state
- difficulty: large number of states ("state explosion")

next chapters: combinatorial optimization

→ similar scenario, but:

- no actions or transitions
- don't search for path, but for configuration ("state") with low cost/high quality

German: Zustandsraumexplosion, kombinatorische Optimierung, Konfiguration

Combinatorial Optimization

Combinatorial Optimization Problems

Definition (combinatorial optimization problem)

A combinatorial optimization problem (COP)

is given by a tuple $\langle C, S, opt, v \rangle$ consisting of:

- ▶ a set of (solution) candidates C
- ▶ a set of solutions $S \subseteq C$
- ▶ an objective sense $opt \in \{min, max\}$
- ▶ an objective function $v: S \to \mathbb{R}$

German: kombinatorisches Optimierungsproblem, Kandidaten, Lösungen, Optimierungsrichtung, Zielfunktion

Remarks:

- "problem" here in another sense (= "instance") than commonly used in computer science
- practically interesting COPs usually have too many candidates to enumerate explicitly

Optimal Solutions

Definition (optimal)

Let $\mathcal{O} = \langle C, S, opt, v \rangle$ be a COP.

The optimal solution quality v^* of \mathcal{O} is defined as

$$v^* = \begin{cases} \min_{c \in S} v(c) & \text{if } opt = \min \\ \max_{c \in S} v(c) & \text{if } opt = \max \end{cases}$$

(v^* is undefined if $S = \emptyset$.)

A solution s of \mathcal{O} is called optimal if $v(s) = v^*$.

German: optimale Lösungsqualität, optimal

20. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Combinatorial Optimization

The basic algorithmic problem we want to solve:

Combinatorial Optimization

Find a solution of good (ideally, optimal) quality for a combinatorial optimization problem $\mathcal O$ or prove that no solution exists.

Good here means close to v^* (the closer, the better).

Combinatorial Optimization

Relevance and Hardness

► There is a huge number of practically important combinatorial optimization problems.

- ▶ Solving these is a central focus of operations research.
- ► Many important combinatorial optimization problems are NP-complete.
- ▶ Most "classical" NP-complete problems can be formulated as combinatorial optimization problems.
- → Examples: TSP, VERTEXCOVER, CLIQUE, BINPACKING, PARTITION

German: Unternehmensforschung, NP-vollständig

20. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Search vs. Optimization

Combinatorial optimization problems have

- ► a search aspect (among all candidates *C*, find a solution from the set *S*) and
- ► an optimization aspect (among all solutions in *S*, find one of high quality).

20. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Pure Search/Optimization Problems

Important special cases arise when one of the two aspects is trivial:

- pure search problems:
 - ▶ all solutions are of equal quality
 - ▶ difficulty is in finding a solution at all
 - ▶ formally: v is a constant function (e.g., constant 0); opt can be chosen arbitrarily (does not matter)
- pure optimization problems:
 - ▶ all candidates are solutions
 - difficulty is in finding solutions of high quality
 - formally: S = C

Example: 8 Queens Problem

8 Queens Problem

How can we

- ▶ place 8 queens on a chess board
- ▶ such that no two queens threaten each other?

German: 8-Damen-Problem

- ▶ originally proposed in 1848
- variants: board size; other pieces; higher dimension

There are 92 solutions, or 12 solutions if we do not count symmetric solutions (under rotation or reflection) as distinct.

20. Combinatorial Optimization: Introduction and Hill-Climbing

Exampl

Formally: 8 Queens Problem

How can we formalize the problem?

idea:

- obviously there must be exactly one queen in each file ("column")
- ▶ describe candidates as 8-tuples, where the *i*-th entry denotes the rank ("row") of the queen in the *i*-th file

formally: $\mathcal{O} = \langle C, S, opt, v \rangle$ with

- $C = \{1, \dots, 8\}^8$
- ▶ $S = \{ \langle r_1, ..., r_8 \rangle \mid \forall 1 \le i < j \le 8 : r_i \ne r_j \land |r_i r_j| \ne |i j| \}$
- v constant, opt irrelevant (pure search problem)

Local Search: Hill Climbing

Algorithms for Combinatorial Optimization Problems

How can we algorithmically solve COPs?

- ▶ formulation as classical state-space search → previous chapters
- ► formulation as constraint network ¬¬ Wednesday
- ► formulation as logical satisfiability problem \rightsquigarrow later
- ▶ formulation as mathematical optimization problem (LP/IP) → not in this course.
- ▶ local search

 → this and next chapter

20. Combinatorial Optimization: Introduction and Hill-Climbing

Local Search: Hill Climbing

Search Methods for Combinatorial Optimization

- ▶ main ideas of heuristic search applicable for COPs \rightsquigarrow states \approx candidates
- ▶ main difference: no "actions" in problem definition
 - ▶ instead, we (as algorithm designers) can choose which candidates to consider neighbors
 - definition of neighborhood critical aspect of designing good algorithms for a given COP
- "path to goal" irrelevant to the user
 - no path costs, parents or generating actions
 - → no search nodes needed

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 9, 2018

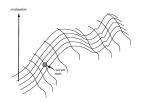

20. Combinatorial Optimization: Introduction and Hill-Climbing

Local Search: Hill Climbing

Local Search: Idea

main ideas of local search algorithms for COPs:

- ▶ heuristic *h* estimates quality of candidates
 - \triangleright for pure optimization: often objective function v itself
 - ▶ for pure search: often distance estimate to closest solution (as in state-space search)
- do not remember paths, only candidates
- ▶ often only one current candidate ~> very memory-efficient (however, not complete or optimal)
- often initialization with random candidate
- ▶ iterative improvement by hill climbing

20. Combinatorial Optimization: Introduction and Hill-Climbing

Local Search: Hill Climbing

Hill Climbing

Hill Climbing (for Maximization Problems)

current := a random candidate

repeat:

next := a neighbor of current with maximum h value **if** h(next) < h(current):

return current

current := next

Remarks:

- search as walk "uphill" in a landscape defined by the neighborhood relation
- heuristic values define "height" of terrain
- analogous algorithm for minimization problems also traditionally called "hill climbing" even though the metaphor does not fully fit

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

20 / 25

Local Search: Hill Climbing

Properties of Hill Climbing

- always terminates if candidate set is finite (Why?)
- ▶ no guarantee that result is a solution
- ▶ if result is a solution, it is locally optimal w.r.t. h, but no global quality guarantees

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 9, 2018

20. Combinatorial Optimization: Introduction and Hill-Climbing

Local Search: Hill Climbing

Example: 8 Queens Problem

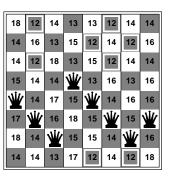

Problem: Place 8 queens on a chess board

such that no two queens threaten each other.

possible heuristic: no. of pairs of queens threatening each other

(formalization as minimization problem)

possible neighborhood: move one queen within its file

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 9, 2018 22 / 25

20. Combinatorial Optimization: Introduction and Hill-Climbing

Local Search: Hill Climbing

Performance of Hill Climbing for 8 Queens Problem

- ▶ problem has 8⁸ ≈ 17 million candidates (reminder: 92 solutions among these)
- ► after random initialization, hill climbing finds a solution in around 14% of the cases
- ▶ only around 4 steps on average!

20. Combinatorial Optimization: Introduction and Hill-Climbing

Summar

Summary

combinatorial optimization problems:

- ▶ find solution of good quality (objective value) among many candidates
- special cases:
 - pure search problems
 - pure optimization problems
- ▶ differences to state-space search: no actions, paths etc.; only "state" matters

often solved via local search:

consider one candidate (or a few) at a time; try to improve it iteratively
