B5.5 Summary

# B5.1 Semantics of Predicate Logic

# Logic: Overview

# Semantics: Motivation

- ▶ interpretations in propositional logic:  
truth assignments for the **propositional variables**
- ▶ There are no propositional variables in predicate logic.
- ▶ instead: interpretation determines meaning  
of the **constant, function and predicate symbols**.
- ▶ meaning of **variable symbols** not determined by interpretation  
but by separate **variable assignment**.

# Interpretations and Variable Assignments

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

## Definition (Interpretation, Variable Assignment)

An **interpretation** (for  $\mathcal{S}$ ) is a pair  $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  of:

- ▶ a non-empty set  $U$  called the **universe** and
- ▶ a function  $\cdot^{\mathcal{I}}$  that assigns a meaning to the constant, function, and predicate symbols:
  - ▶  $c^{\mathcal{I}} \in U$  for constant symbols  $c \in \mathcal{C}$
  - ▶  $f^{\mathcal{I}} : U^k \rightarrow U$  for  $k$ -ary function symbols  $f \in \mathcal{F}$
  - ▶  $P^{\mathcal{I}} \subseteq U^k$  for  $k$ -ary predicate symbols  $P \in \mathcal{P}$

A **variable assignment** (for  $\mathcal{S}$  and universe  $U$ )

is a function  $\alpha : \mathcal{V} \rightarrow U$ .

**German:** Interpretation, Variablenzuweisung, Universum (or Grundmenge)

# Interpretations and Variable Assignments: Example

## Example

signature:  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  with  $\mathcal{V} = \{x, y, z\}$ ,  
 $\mathcal{C} = \{\text{zero}, \text{one}\}$ ,  $\mathcal{F} = \{\text{sum}, \text{product}\}$ ,  $\mathcal{P} = \{\text{SquareNumber}\}$   
 $\text{ar}(\text{sum}) = \text{ar}(\text{product}) = 2$ ,  $\text{ar}(\text{SquareNumber}) = 1$

$\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  with

- ▶  $U = \{u_0, u_1, u_2, u_3, u_4, u_5, u_6\}$
- ▶  $\text{zero}^{\mathcal{I}} = u_0$
- ▶  $\text{one}^{\mathcal{I}} = u_1$
- ▶  $\text{sum}^{\mathcal{I}}(u_i, u_j) = u_{(i+j) \bmod 7}$  for all  $i, j \in \{0, \dots, 6\}$
- ▶  $\text{product}^{\mathcal{I}}(u_i, u_j) = u_{(i \cdot j) \bmod 7}$  for all  $i, j \in \{0, \dots, 6\}$
- ▶  $\text{SquareNumber}^{\mathcal{I}} = \{u_0, u_1, u_2, u_4\}$

$\alpha = \{x \mapsto u_5, y \mapsto u_5, z \mapsto u_0\}$

## Semantics: Informally

**Example:**  $(\forall x(\text{Block}(x) \rightarrow \text{Red}(x)) \wedge \text{Block}(a))$

“For all objects  $x$ : if  $x$  is a block, then  $x$  is red.

Also, the object called  $a$  is a block.”

- ▶ **Terms** are interpreted as **objects**.
- ▶ **Unary predicates** denote properties of objects  
(to be a block, to be red, to be a square number, . . . )
- ▶ **General predicates** denote relations between objects  
(to be someone’s child, to have a common divisor, . . . )
- ▶ **Universally quantified** formulas (“ $\forall$ ”) are true  
if they hold for **every** object in the universe.
- ▶ **Existentially quantified** formulas (“ $\exists$ ”) are true  
if they hold for **at least one** object in the universe.

# Interpretations of Terms

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

## Definition (Interpretation of a Term)

Let  $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  be an interpretation for  $\mathcal{S}$ ,  
and let  $\alpha$  be a variable assignment for  $\mathcal{S}$  and universe  $U$ .

Let  $t$  be a term over  $\mathcal{S}$ .

The **interpretation of  $t$**  under  $\mathcal{I}$  and  $\alpha$ , written as  $t^{\mathcal{I}, \alpha}$ ,  
is the element of the universe  $U$  defined as follows:

- ▶ If  $t = x$  with  $x \in \mathcal{V}$  ( $t$  is a **variable term**):  
 $x^{\mathcal{I}, \alpha} = \alpha(x)$
- ▶ If  $t = c$  with  $c \in \mathcal{C}$  ( $t$  is a **constant term**):  
 $c^{\mathcal{I}, \alpha} = c^{\mathcal{I}}$
- ▶ If  $t = f(t_1, \dots, t_k)$  ( $t$  is a **function term**):  
 $f(t_1, \dots, t_k)^{\mathcal{I}, \alpha} = f^{\mathcal{I}}(t_1^{\mathcal{I}, \alpha}, \dots, t_k^{\mathcal{I}, \alpha})$

# Interpretations of Terms: Example

## Example

signature:  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$

with  $\mathcal{V} = \{x, y, z\}$ ,  $\mathcal{C} = \{\text{zero}, \text{one}\}$ ,  $\mathcal{F} = \{\text{sum}, \text{product}\}$ ,  
 $\text{ar}(\text{sum}) = \text{ar}(\text{product}) = 2$

$\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  with

- ▶  $U = \{u_0, u_1, u_2, u_3, u_4, u_5, u_6\}$
- ▶  $\text{zero}^{\mathcal{I}} = u_0$
- ▶  $\text{one}^{\mathcal{I}} = u_1$
- ▶  $\text{sum}^{\mathcal{I}}(u_i, u_j) = u_{(i+j) \bmod 7}$  for all  $i, j \in \{0, \dots, 6\}$
- ▶  $\text{product}^{\mathcal{I}}(u_i, u_j) = u_{(i \cdot j) \bmod 7}$  for all  $i, j \in \{0, \dots, 6\}$

$\alpha = \{x \mapsto u_5, y \mapsto u_5, z \mapsto u_0\}$

# Interpretations of Terms: Example (ctd.)

## Example (ctd.)

- ▶  $\text{zero}^{\mathcal{I}, \alpha} =$
- ▶  $y^{\mathcal{I}, \alpha} =$
- ▶  $\text{sum}(x, y)^{\mathcal{I}, \alpha} =$
- ▶  $\text{product}(\text{one}, \text{sum}(x, \text{zero}))^{\mathcal{I}, \alpha} =$

# Semantics of Predicate Logic Formulas

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

## Definition (Formula is Satisfied or True)

Let  $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  be an interpretation for  $\mathcal{S}$ ,  
 and let  $\alpha$  be a variable assignment for  $\mathcal{S}$  and universe  $U$ .  
 We say that  $\mathcal{I}$  and  $\alpha$  **satisfy** a predicate logic formula  $\varphi$   
 (also:  $\varphi$  is **true** under  $\mathcal{I}$  and  $\alpha$ ), written:  $\mathcal{I}, \alpha \models \varphi$ ,  
 according to the following inductive rules:

$$\mathcal{I}, \alpha \models P(t_1, \dots, t_k) \text{ iff } \langle t_1^{\mathcal{I}, \alpha}, \dots, t_k^{\mathcal{I}, \alpha} \rangle \in P^{\mathcal{I}}$$

$$\mathcal{I}, \alpha \models (t_1 = t_2) \text{ iff } t_1^{\mathcal{I}, \alpha} = t_2^{\mathcal{I}, \alpha}$$

$$\mathcal{I}, \alpha \models \neg \varphi \text{ iff } \mathcal{I}, \alpha \not\models \varphi$$

$$\mathcal{I}, \alpha \models (\varphi \wedge \psi) \text{ iff } \mathcal{I}, \alpha \models \varphi \text{ and } \mathcal{I}, \alpha \models \psi$$

$$\mathcal{I}, \alpha \models (\varphi \vee \psi) \text{ iff } \mathcal{I}, \alpha \models \varphi \text{ or } \mathcal{I}, \alpha \models \psi \quad \dots$$

**German:**  $\mathcal{I}$  und  $\alpha$  erfüllen  $\varphi$  (also:  $\varphi$  ist wahr unter  $\mathcal{I}$  und  $\alpha$ )

# Semantics of Predicate Logic Formulas

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

## Definition (Formula is Satisfied or True)

...

$\mathcal{I}, \alpha \models \forall x \varphi$  iff  $\mathcal{I}, \alpha[x := u] \models \varphi$  for all  $u \in U$

$\mathcal{I}, \alpha \models \exists x \varphi$  iff  $\mathcal{I}, \alpha[x := u] \models \varphi$  for at least one  $u \in U$

where  $\alpha[x := u]$  is the same variable assignment as  $\alpha$ ,  
except that it maps variable  $x$  to the value  $u$ .

Formally:

$$(\alpha[x := u])(z) = \begin{cases} u & \text{if } z = x \\ \alpha(z) & \text{if } z \neq x \end{cases}$$

# Semantics: Example

## Example

signature:  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$

with  $\mathcal{V} = \{x, y, z\}$ ,  $\mathcal{C} = \{a, b\}$ ,  $\mathcal{F} = \emptyset$ ,  $\mathcal{P} = \{\text{Block}, \text{Red}\}$ ,  
 $\text{ar}(\text{Block}) = \text{ar}(\text{Red}) = 1$ .

$\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  with

- ▶  $U = \{u_1, u_2, u_3, u_4, u_5\}$
- ▶  $a^{\mathcal{I}} = u_1$
- ▶  $b^{\mathcal{I}} = u_3$
- ▶  $\text{Block}^{\mathcal{I}} = \{u_1, u_2\}$
- ▶  $\text{Red}^{\mathcal{I}} = \{u_1, u_2, u_3, u_5\}$

$\alpha = \{x \mapsto u_1, y \mapsto u_2, z \mapsto u_1\}$

# Semantics: Example (ctd.)

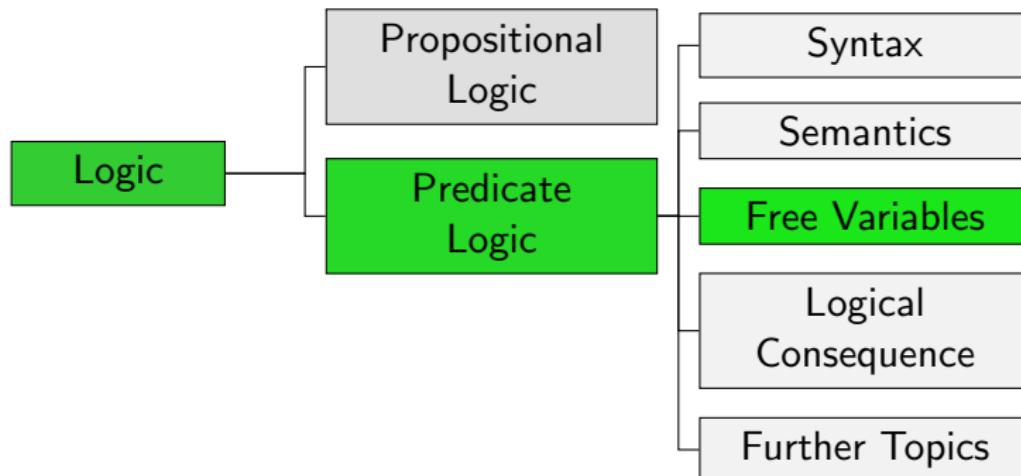

## Example (ctd.)

### Questions:

- ▶  $\mathcal{I}, \alpha \models (\text{Block}(b) \vee \neg \text{Block}(b))?$
- ▶  $\mathcal{I}, \alpha \models (\text{Block}(x) \rightarrow (\text{Block}(x) \vee \neg \text{Block}(y)))?$
- ▶  $\mathcal{I}, \alpha \models (\text{Block}(a) \wedge \text{Block}(b))?$
- ▶  $\mathcal{I}, \alpha \models \forall x (\text{Block}(x) \rightarrow \text{Red}(x))?$

## B5.2 Free and Bound Variables

# Logic: Overview

# Free and Bound Variables: Motivation

## Question:

- ▶ Consider a signature with variable symbols  $\{x_1, x_2, x_3, \dots\}$  and an interpretation  $\mathcal{I}$ .
- ▶ Which parts of the definition of  $\alpha$  are relevant to decide whether  $\mathcal{I}, \alpha \models (\forall x_4(R(x_4, x_2) \vee (f(x_3) = x_4)) \vee \exists x_3 S(x_3, x_2))$ ?
- ▶  $\alpha(x_1), \alpha(x_5), \alpha(x_6), \alpha(x_7), \dots$  are irrelevant since those variable symbols occur in no formula.
- ▶  $\alpha(x_4)$  also is irrelevant: the variable occurs in the formula, but all occurrences are bound by a surrounding quantifier.
- ▶  $\rightsquigarrow$  only assignments for free variables  $x_2$  and  $x_3$  relevant

German: gebundene und freie Variablen

# Variables of a Term

## Definition (Variables of a Term)

Let  $t$  be a term. The set of **variables** that occur in  $t$ , written as  $\text{var}(t)$ , is defined as follows:

- ▶  $\text{var}(x) = \{x\}$   
for variable symbols  $x$
- ▶  $\text{var}(c) = \emptyset$   
for constant symbols  $c$
- ▶  $\text{var}(f(t_1, \dots, t_l)) = \text{var}(t_1) \cup \dots \cup \text{var}(t_l)$   
for function terms

**terminology:** A term  $t$  with  $\text{var}(t) = \emptyset$  is called **ground term**.

**German:** Grundterm

**example:**  $\text{var}(\text{product}(x, \text{sum}(k, y))) =$

# Free and Bound Variables of a Formula

## Definition (Free Variables)

Let  $\varphi$  be a predicate logic formula. The set of **free variables** of  $\varphi$ , written as  $\text{free}(\varphi)$ , is defined as follows:

- ▶  $\text{free}(P(t_1, \dots, t_k)) = \text{var}(t_1) \cup \dots \cup \text{var}(t_k)$
- ▶  $\text{free}(t_1 = t_2) = \text{var}(t_1) \cup \text{var}(t_2)$
- ▶  $\text{free}(\neg\varphi) = \text{free}(\varphi)$
- ▶  $\text{free}((\varphi \wedge \psi)) = \text{free}((\varphi \vee \psi)) = \text{free}(\varphi) \cup \text{free}(\psi)$
- ▶  $\text{free}(\forall x \varphi) = \text{free}(\exists x \varphi) = \text{free}(\varphi) \setminus \{x\}$

**Example:**  $\text{free}((\forall x_4(R(x_4, x_2) \vee (f(x_3) = x_4)) \vee \exists x_3 S(x_3, x_2)))$

=

# Closed Formulas/Sentences

Note: Let  $\varphi$  be a formula and let  $\alpha$  and  $\beta$  variable assignments with  $\alpha(x) = \beta(x)$  for all free variables  $x$  of  $\varphi$ .

Then  $\mathcal{I}, \alpha \models \varphi$  iff  $\mathcal{I}, \beta \models \varphi$ .

In particular,  $\alpha$  is **completely irrelevant** if  $\text{free}(\varphi) = \emptyset$ .

## Definition (Closed Formulas/Sentences)

A formula  $\varphi$  without free variables (i. e.,  $\text{free}(\varphi) = \emptyset$ ) is called **closed formula** or **sentence**.

If  $\varphi$  is a sentence, then we often write  $\mathcal{I} \models \varphi$  instead of  $\mathcal{I}, \alpha \models \varphi$ , since the definition of  $\alpha$  does not influence whether  $\varphi$  is true under  $\mathcal{I}$  and  $\alpha$  or not.

Formulas with at least one free variable are called **open**.

German: geschlossene Formel/Satz, offene Formel

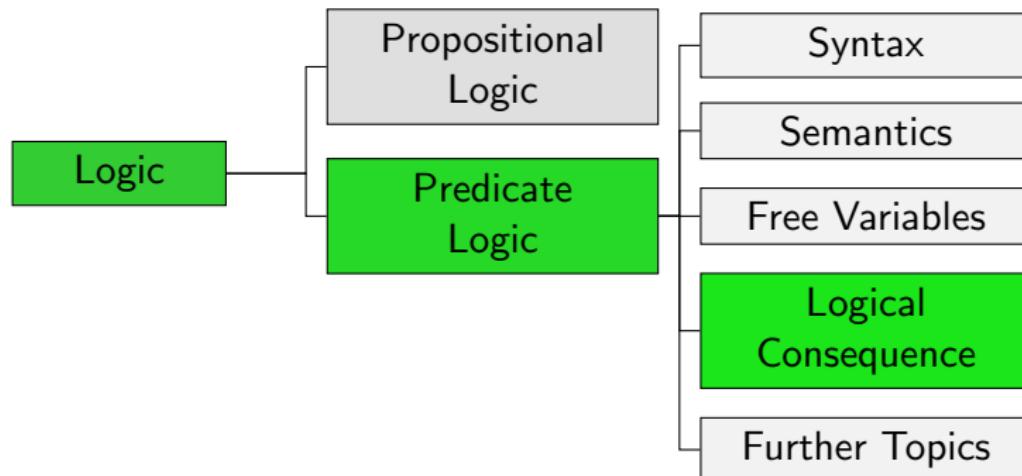

# Closed Formulas/Sentences: Examples

**Question:** Which of the following formulas are sentences?

- ▶  $(\text{Block}(b) \vee \neg \text{Block}(b))$
- ▶  $(\text{Block}(x) \rightarrow (\text{Block}(x) \vee \neg \text{Block}(y)))$
- ▶  $(\text{Block}(a) \wedge \text{Block}(b))$
- ▶  $\forall x(\text{Block}(x) \rightarrow \text{Red}(x))$

## B5.3 Logical Consequences

# Logic: Overview

# Terminology for Formulas

The terminology we introduced for propositional logic similarly applies to predicate logic:

- ▶ Interpretation  $\mathcal{I}$  and variable assignment  $\alpha$  form a **model** of the formula  $\varphi$  if  $\mathcal{I}, \alpha \models \varphi$ .
- ▶ Formula  $\varphi$  is **satisfiable** if  $\mathcal{I}, \alpha \models \varphi$  for at least one  $\mathcal{I}, \alpha$ .
- ▶ Formula  $\varphi$  is **falsifiable** if  $\mathcal{I}, \alpha \not\models \varphi$  for at least one  $\mathcal{I}, \alpha$ .
- ▶ Formula  $\varphi$  is **valid** if  $\mathcal{I}, \alpha \models \varphi$  for all  $\mathcal{I}, \alpha$ .
- ▶ Formula  $\varphi$  is **unsatisfiable** if  $\mathcal{I}, \alpha \not\models \varphi$  for all  $\mathcal{I}, \alpha$ .
- ▶ Formulas  $\varphi$  and  $\psi$  are **logically equivalent**, written as  $\varphi \equiv \psi$ , if they have the same models.

**German:** Modell, erfüllbar, falsifizierbar, gültig, unerfüllbar,  
logisch äquivalent

# Sets of Formulas: Semantics

## Definition (Satisfied/True Sets of Formulas)

Let  $\mathcal{S}$  be a signature,  $\Phi$  a set of formulas over  $\mathcal{S}$ ,  
 $\mathcal{I}$  an interpretation for  $\mathcal{S}$  and  $\alpha$  a variable assignment for  $\mathcal{S}$   
and the universe of  $\mathcal{I}$ .

We say that  $\mathcal{I}$  and  $\alpha$  **satisfy** the formulas  $\Phi$   
(also:  $\Phi$  is **true** under  $\mathcal{I}$  and  $\alpha$ ), written as:  $\mathcal{I}, \alpha \models \Phi$ ,  
if  $\mathcal{I}, \alpha \models \varphi$  for all  $\varphi \in \Phi$ .

**German:**  $\mathcal{I}$  und  $\alpha$  erfüllen  $\Phi$ ,  $\Phi$  ist wahr unter  $\mathcal{I}$  und  $\alpha$

# Terminology for Sets of Formulas and Sentences

- ▶ Again, we use the same notations and concepts as in propositional logic.

## Example:

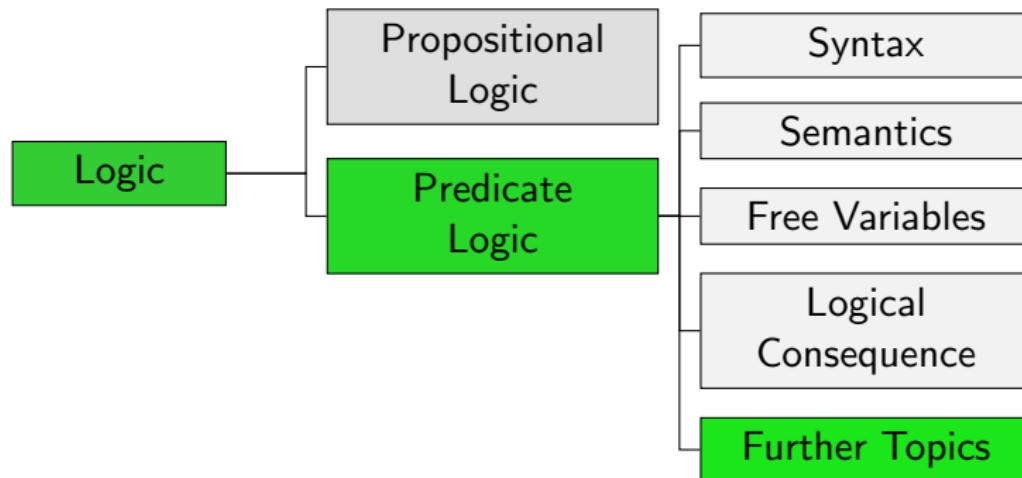

- ▶ A set of formulas  $\Phi$  is satisfiable if  $\mathcal{I}, \alpha \models \Phi$  for at least one  $\mathcal{I}, \alpha$ .
- ▶ A set of formulas  $\Phi$  (logically) implies formula  $\psi$ , written as  $\Phi \models \psi$ , if all models of  $\Phi$  are models of  $\psi$ .
- ▶ All concepts can be used for the special case of **sentences** (or sets of sentences). In this case we usually omit  $\alpha$ .

## Examples:

- ▶ Interpretation  $\mathcal{I}$  is a **model** of a sentence  $\varphi$  if  $\mathcal{I} \models \varphi$ .
- ▶ Sentence  $\varphi$  is **unsatisfiable** if  $\mathcal{I} \not\models \varphi$  for all  $\mathcal{I}$ .
- ▶ similarly:
  - ▶  $\varphi \models \psi$  if  $\{\varphi\} \models \psi$
  - ▶  $\Phi \models \Psi$  if  $\Phi \models \psi$  for all  $\psi \in \Psi$

## B5.4 Further Topics

# Logic: Overview

# Further Topics

Based on these definitions we could cover the same topics as in propositional logic:

- ▶ important **logical equivalences**
- ▶ **normal forms**
- ▶ theorems about reasoning (deduction theorem etc.)

We briefly discuss some general results on those topics but will not go into detail.

# Logical Equivalences

- ▶ All **logical equivalences of propositional logic** also hold in predicate logic (e.g.,  $(\varphi \vee \psi) \equiv (\psi \vee \varphi)$ ). ([Why?](#))
- ▶ Additionally the following equivalences and implications hold:

$$(\forall x \varphi \wedge \forall x \psi) \equiv \forall x(\varphi \wedge \psi)$$

$$(\forall x \varphi \vee \forall x \psi) \models \forall x(\varphi \vee \psi) \quad \text{but not vice versa}$$

$$(\forall x \varphi \wedge \psi) \equiv \forall x(\varphi \wedge \psi) \quad \text{if } x \notin \text{free}(\psi)$$

$$(\forall x \varphi \vee \psi) \equiv \forall x(\varphi \vee \psi) \quad \text{if } x \notin \text{free}(\psi)$$

$$\neg \forall x \varphi \equiv \exists x \neg \varphi$$

$$\exists x(\varphi \vee \psi) \equiv (\exists x \varphi \vee \exists x \psi)$$

$$\exists x(\varphi \wedge \psi) \models (\exists x \varphi \wedge \exists x \psi) \quad \text{but not vice versa}$$

$$(\exists x \varphi \vee \psi) \equiv \exists x(\varphi \vee \psi) \quad \text{if } x \notin \text{free}(\psi)$$

$$(\exists x \varphi \wedge \psi) \equiv \exists x(\varphi \wedge \psi) \quad \text{if } x \notin \text{free}(\psi)$$

$$\neg \exists x \varphi \equiv \forall x \neg \varphi$$

# Normal Forms

Analogously to DNF and CNF for propositional logic there are several normal forms for predicate logic, such as

- ▶ **negation normal form (NNF):**  
negation symbols ( $\neg$ ) are only allowed in front of atoms
- ▶ **prenex normal form:**  
quantifiers must form the outermost part of the formula
- ▶ **Skolem normal form:**  
prenex normal form without existential quantifiers

**German:** Negationsnormalform, Pränexnormalform, Skolemnormalform

## Normal Forms (ctd.)

Efficient methods transform formula  $\varphi$

- ▶ into an **equivalent** formula in **negation normal form**,
- ▶ into an **equivalent** formula in **prenex normal form**, or
- ▶ into an **equisatisfiable** formula in **Skolem normal form**.

German: erfüllbarkeitsäquivalent

# B5.5 Summary

# Summary

bound vs. free variables:

- ▶ **bound** vs. **free** variables: to decide if  $\mathcal{I}, \alpha \models \varphi$ , only free variables in  $\alpha$  matter
- ▶ **sentences** (closed formulas): formulas without free variables

Once the basic definitions are in place, predicate logic can be developed in the same way as propositional logic:

- ▶ **logical consequences**
- ▶ **logical equivalences**
- ▶ **normal forms**
- ▶ **deduction theorem** etc.

# Other Logics

- ▶ We considered **first-order** predicate logic.
- ▶ **Second-order** predicate logic allows quantifying over predicate symbols.
- ▶ There are intermediate steps, e. g. monadic second-order logic (all quantified predicates are unary).
- ▶ **Modal logics** have new operators  $\Box$  and  $\Diamond$ .
  - ▶ classical meaning:  $\Box\varphi$  for “ $\varphi$  is necessary”,  
 $\Diamond\varphi$  for “ $\varphi$  is possible”.
  - ▶ temporal logic:  $\Box\varphi$  for “ $\varphi$  is always true in the future”,  
 $\Diamond\varphi$  for “ $\varphi$  is true at some point in the future”
  - ▶ deontic logic:  $\Box\varphi$  for “ $\varphi$  is obligatory”,  
 $\Diamond\varphi$  for “ $\varphi$  is permitted”
  - ▶ ...
- ▶ In **fuzzy logic**, formulas are not true or false but have values between 0 and 1.
