April 15, 2020 — C8. Type-1 and Type-0 Languages: Closure & Decidability

C8.1 Turing Machines vs. Grammars

C8.2 Closure Properties and Decidability

Overview

C8.1 Turing Machines vs. Grammars

Reminder: Turing Machines – Conceptually

Reminder: Nondeterministic Turing Machine

Definition (Nondeterministic Turing Machine)

A nondeterministic **Turing machine (NTM)** is given by a 7-tuple $M = \langle Q, \Sigma, \Gamma, \delta, q_0, \square, E \rangle$ with:

- ▶ Q finite non-empty set of **states**
- ▶ $\Sigma \neq \emptyset$ finite **input alphabet**
- ▶ $\Gamma \supset \Sigma$ finite **tape alphabet**
- ▶ $\delta : (Q \setminus E) \times \Gamma \rightarrow \mathcal{P}(Q \times \Gamma \times \{L, R, N\})$ **transition function**
- ▶ $q_0 \in Q$ **start state**
- ▶ $\square \in \Gamma \setminus \Sigma$ **blank symbol**
- ▶ $E \subseteq Q$ **end states**

One Automata Model for Two Grammar Types?

Don't we need different automata models for context-sensitive and type-0 languages?

Picture courtesy of stockimages / FreeDigitalPhotos.net

Linear Bounded Automata: Idea

- ▶ **Linear bounded automata** are NTMs that may only use the **part of the tape occupied by the input word**.
- ▶ one way of formalizing this: NTMs where blank symbol may never be replaced by a different symbol

Linear Bounded Turing Machines: Definition

Definition (Linear Bounded Automata)

An NTM $M = \langle Q, \Sigma, \Gamma, \delta, q_0, \square, E \rangle$

is called a **linear bounded automaton (LBA)**

if for all $q \in Q \setminus E$ and all transition rules $\langle q', c, y \rangle \in \delta(q, \square)$ we have $c = \square$.

German: linear beschränkte Turingmaschine

LBAs Accept Type-1 Languages

Theorem

The languages that can be accepted by linear bounded automata are exactly the context-sensitive (type-1) languages.

Without proof.

proof sketch for grammar \Rightarrow NTM direction:

- ▶ computation of the NTM follows the production of the word in the grammar **in opposite order**
- ▶ accept when only start symbol (and blanks) are left on the tape
- ▶ because language is context-sensitive, we never need additional space on the tape (empty word needs special treatment)

NTMs Accept Type-0 Languages

Theorem

The languages that can be accepted by nondeterministic Turing machines are exactly the type-0 languages.

Without proof.

proof sketch for grammar \Rightarrow NTM direction:

- ▶ analogous to previous proof
- ▶ for grammar rules $w_1 \rightarrow w_2$ with $|w_1| > |w_2|$, we must “insert” symbols into the existing tape content; this is a bit tedious, but not very difficult

Deterministic Turing Machines

Definition (Deterministic Turing Machine)

A **deterministic Turing machine (DTM)** is a Turing machine

$M = \langle Q, \Sigma, \Gamma, \delta, q_0, \square, E \rangle$ with

$\delta : (Q \setminus E) \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, N\}$.

German: deterministische Turingmaschine

Deterministic Turing Machines vs. Type-0 Languages

Theorem

For every type-0 language L there is a deterministic Turing machine M with $\mathcal{L}(M) = L$.

Without proof.

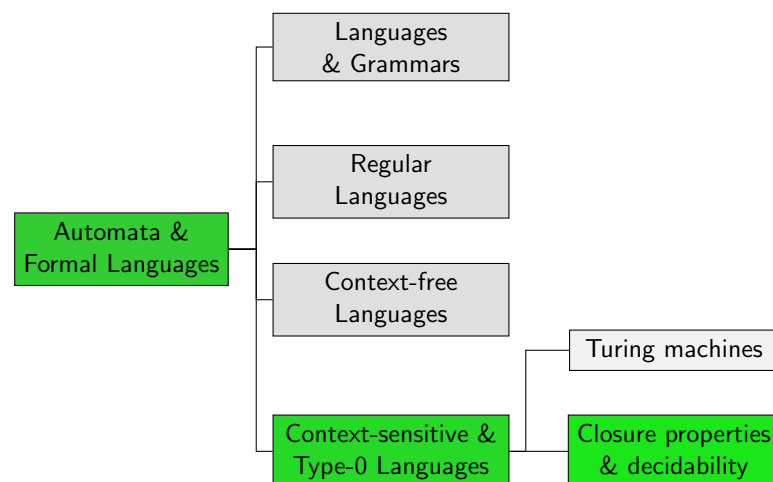

proof sketch:

- ▶ Let M' be an NTM with $\mathcal{L}(M') = L$.
- ▶ It is possible to construct a DTM that systematically searches for an accepting configuration in the computation tree of M' .

Note: It is an open problem whether an analogous theorem holds for type-1 languages and deterministic LBAs.

C8.2 Closure Properties and Decidability

Overview

Closure Properties

| | Intersection | Union | Complement | Concatenation | Star |
|--------|--------------------|--------------------|--------------------|--------------------|--------------------|
| Type 3 | Yes | Yes | Yes | Yes | Yes |
| Type 2 | No | Yes | No | Yes | Yes |
| Type 1 | Yes ⁽²⁾ | Yes ⁽¹⁾ | Yes ⁽²⁾ | Yes ⁽¹⁾ | Yes ⁽¹⁾ |
| Type 0 | Yes ⁽²⁾ | Yes ⁽¹⁾ | No ⁽³⁾ | Yes ⁽¹⁾ | Yes ⁽¹⁾ |

Proofs?

(1) proof via grammars, similar to context-free cases

(2) without proof

(3) proof in later chapters (part D)

Decidability

| | Word problem | Emptiness problem | Equivalence problem | Intersection problem |
|--------|--------------------|-------------------|---------------------|----------------------|
| Type 3 | Yes | Yes | Yes | Yes |
| Type 2 | Yes | Yes | No | No |
| Type 1 | Yes ⁽¹⁾ | No ⁽³⁾ | No ⁽²⁾ | No ⁽²⁾ |
| Type 0 | No ⁽⁴⁾ | No ⁽⁴⁾ | No ⁽⁴⁾ | No ⁽⁴⁾ |

Proofs?

- (1) same argument we used for context-free languages
- (2) because already undecidable for context-free languages
- (3) without proof
- (4) proofs in later chapters (part D)

Summary

- ▶ **Turing machines** accept exactly the **type-0** languages. This is also true for **deterministic Turing machines**.
- ▶ **Linear bounded automata** accept exactly the **context-sensitive** languages.
- ▶ The context-sensitive and type-0 languages are **closed** under **almost all** usual operations.
 - ▶ exception: **type-0 not closed** under **complement**
- ▶ For context-sensitive and type-0 languages **almost no problem is decidable**.
 - ▶ exception: **word problem** for **context-sensitive lang.** decidable
