B8.1 Push-Down Automata

B8.2 Summary

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

#### Limitations of Finite Automata

- ▶ Language *L* is regular.⇒ There is a finite automaton that recognizes *L*.
- ► What information can a finite automaton "store" about the already read part of the word?
- Infinite memory would be required for  $L = \{x_1x_2 \dots x_nx_n \dots x_2x_1 \mid n > 0, x_i \in \{a, b\}\}.$
- ▶ therefore: extension of the automata model with memory

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

#### Stack

A stack is a data structure following the last-in-first-out (LIFO) principle supporting the following operations:

- push: puts an object on top of the stack
- pop: removes the object at the top of the stack
- peek: returns the top object without removing it

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

# Push-down Automaton for $\{a^nb^n \mid n \in \mathbb{N}_0\}$ : Idea

- As long as you read symbols a, push an A on the stack.
- As soon as you read a symbol b, pop an A off the stack as long as you read b.
- ► If reading the input is finished exactly when the stack becomes empty, accept the input.
- ▶ If there is no A to pop when reading a b, or there is still an A on the stack after reading all input symbols, or if you read an a following a b then reject the input.

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

#### Push-down Automata: Non-determinism

- ► PDAs are non-deterministic and can allow several next transitions from a configuration.
- Like NFAs, PDAs can have transitions that do not read a symbol from the input.
- ► Similarly, there can be transitions that do not pop and/or push a symbol off/to the stack.

Deterministic variants of PDAs are strictly less expressive, i. e. there are languages that can be recognized by a (non-deterministic) PDA but not the deterministic variant.

### Push-down Automata: Definition

#### Definition (Push-down Automaton)

A push-down automaton (PDA) is a 6-tuple

 $M = \langle Q, \Sigma, \Gamma, \delta, q_0, F \rangle$  with

- Q finite set of states
- $\triangleright$   $\Sigma$  the input alphabet
- Γ the stack alphabet
- ▶  $\delta: Q \times (\Sigma \cup \{\varepsilon\}) \times (\Gamma \cup \{\varepsilon\}) \rightarrow \mathcal{P}(Q \times (\Gamma \cup \{\varepsilon\}))$  the transition function
- $ightharpoonup q_0 \in Q$  the start state
- $ightharpoonup F \subset Q$  is the set of accept states

Push-Down Automata

#### Push-down Automata: Transition Function

Let  $M = \langle Q, \Sigma, \Gamma, \delta, q_0, F \rangle$  be a push-down automaton.

What is the Intuitive Meaning of the Transition Function  $\delta$ ?

 $\triangleright \langle q', B \rangle \in \delta(q, a, A)$ : If M is in state q, reads symbol a and has A as the topmost stack symbol, then M can transition to q' in the next step popping A off the stack and pushing B on the stack.

- ightharpoonup special case  $a=\varepsilon$  is allowed (spontaneous transition)
- ightharpoonup special case  $A = \varepsilon$  is allowed (no pop)
- ightharpoonup special case  $B = \varepsilon$  is allowed (no push)

B8. Context-free Languages: Push-Down Automata

# Push-down Automaton for $\{a^nb^n \mid n \in \mathbb{N}_0\}$ : Formally

 $M = \langle \{q_0, q_1, q_2, q_3\}, \{a, b\}, \{A, \#\}, \delta, q_0, \{q_0, q_3\} \rangle$  with

$$\delta(q_0, \mathtt{a}, \mathtt{A}) = \emptyset$$
  $\delta(q_0, \mathtt{a}, \mathtt{A})$ 

$$\delta(q_0, \mathtt{b}, \mathtt{A}) = \emptyset$$

$$\delta(q_0, \varepsilon, \mathtt{A}) = \emptyset$$

$$\delta(q_0,\mathtt{a},\mathtt{\#})=\emptyset$$

$$\delta(q_0,\mathtt{b},\mathtt{\#})=\emptyset$$

$$\delta(q_0,arepsilon, \#) = \emptyset$$

$$\delta(q_0,\mathtt{a},arepsilon)=\emptyset$$

$$\delta(q_0,\mathtt{b},arepsilon)=\emptyset$$

$$\delta(q_0, \varepsilon, \varepsilon) = \{(q_1, \#)\}$$

$$\delta(\textit{q}_1, \texttt{a}, \texttt{A}) = \emptyset$$

$$\delta(q_1, \mathtt{a}, \#) = \emptyset$$

$$\delta(q_1,\mathtt{b},\#)=\emptyset$$

 $\delta(q_1,\mathtt{b},\mathtt{A})=\{(q_2,arepsilon)\}$ 

$$\delta(q_1, \varepsilon, \mathtt{A}) = \emptyset$$
  
 $\delta(q_1, \varepsilon, \mathtt{\#}) = \emptyset$ 

$$\delta(q_1, \mathbf{a}, \varepsilon) = \{(q_1, \mathbf{A})\}$$

$$\delta(\textit{q}_1,\texttt{b},\varepsilon)=\emptyset$$

$$\delta(q_1, \varepsilon, \varepsilon) = \emptyset$$

$$\delta(q_2,\mathtt{a},\mathtt{A})=\emptyset$$

$$\delta(q_2, b, A) = \{(q_2, \varepsilon)\}$$

$$\delta(q_2, \varepsilon, A) = \emptyset$$

$$\delta(q_2,\mathtt{a},\mathtt{\#})=\emptyset$$

$$\delta(q_2, \mathtt{b}, \mathtt{\#}) = \emptyset$$

$$\delta(q_2, \varepsilon, \#) = \{(q_3, \varepsilon)\}$$

$$\delta(q_2,\mathtt{a},arepsilon)=\emptyset$$

$$\delta(q_2,\mathtt{b},arepsilon)=\emptyset$$

$$\delta(a_2 \in \varepsilon) = \emptyset$$

and 
$$\delta(q_3, x, y) = \emptyset$$
 for all  $x \in \{a, b, \varepsilon\}$ ,  $y \in \{A, \#, \varepsilon\}$ 

$$\delta(q_2,\mathtt{b},arepsilon)=\emptyset$$

$$\delta(q_2, \varepsilon, \varepsilon) = \emptyset$$

Push-Down Automata

## Push-down Automata: Accepted Words

Definition

A PDA  $M = \langle Q, \Sigma, \Gamma, \delta, q_0, F \rangle$  accepts input w

if it can be written as  $w=w_1w_2\dots w_m$  where each  $w_i\in\Sigma\cup\{\varepsilon\}$  and sequences of states  $r_0,r_1,\dots,r_m\in Q$  and strings  $s_0,s_1,\dots,s_m\in\Gamma^*$  exist

that satisfy the following three conditions:

- ② For  $i=0,\ldots,m-1$ , we have  $(r_{i+1},b)\in\delta(r_i,w_{i+1},a)$ , where  $s_i=at$  and  $s_{i+1}=bt$  for some  $a,b\in\Gamma\cup\{\varepsilon\}$  and  $t\in\Gamma^*$ .
- $r_m \in F$

The strings  $s_i$  represent the sequence of stack contents.

Push-Down Automata

### PDA: Recognized Language

Definition (Language Recognized by an NFA)

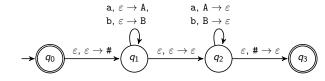

Let M be a PDA with input alphabet  $\Sigma$ .

The language recognized by M is defined as  $\mathcal{L}(M) = \{ w \in \Sigma^* \mid w \text{ is accepted by } M \}.$ 

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

## Recognized Language: Exercise

What language does this PDA recognize?

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

# PDAs Recognize Exactly the Context-free Languages

#### Theorem

A language L is context-free if and only if L is recognized by a push-down automaton.

B8. Context-free Languages: Push-Down Automata

# B8.2 Summary

B8. Context-free Languages: Push-Down Automata

Push-Down Automata

### PDAs: Exercise (if time)

Assume you want to have a possible transition from state q to state q' in your PDA that

- processes symbol c from the input word,
- > can only be taken if the top stack symbol is A,
- b does not pop A off the stack, and
- pushes B.

What problem do you encounter? How can you work around it?

B8. Context-free Languages: Push-Down Automata

## Summary

- ▶ Push-down automata (PDAs) extend NFAs with memory (only stack access)
- ► The languages recognized by PDAs are exactly the context-free languages.
