Result for Merge Sort

"The running time of merge sort grows asymptotically as fast as $n \log_2 n$."

Theorem

Bottom-up merge sort has linearithmic running time, i.e. there are constants $c, c', n_0 > 0$, such that for all $n \ge n_0$: $cn \log_2 n \le T(n) \le c' n \log_2 n$.

- When determining the bounds, we ignored lower-order terms (constant and n) or let them disappear.
- We were not interested in the exact values of the constants but were satisfied if there exist some suitable constants.
- The running time for small *n* is not that important.

Previous Results

Theorem

The merge step has linear running time, i.e., there are constants $c, c', n_0 > 0$ such that for all $n \ge n_0$: $cn \le T(n) \le c'n$.

Theorem

Merge sort has linearithmic running time, i.e. there are constants $c, c', n_0 > 0$, such that for all $n \ge n_0$: $cn \log_2 n \le T(n) \le c' n \log_2 n$.

Theorem

Selection sort has quadratic running time, i.e., there are constants $c > 0, c' > 0, n_0 > 0$ such that for $n \ge n_0$: $cn^2 \le T(n) \le c'n^2$.

Algorithms and Data Structures

Can't we write this more compactly?

Symbol Theta

Definition

For a function $g : \mathbb{N} \to \mathbb{R}$, we denote by $\Theta(g)$ the set of all functions $f : \mathbb{N} \to \mathbb{R}$ that grow asymptotically as fast as g:

 $\Theta(g) = \{f \mid \exists c > 0 \ \exists c' > 0 \ \exists n_0 > 0 \ \forall n \ge n_0 : \\ c \cdot g(n) \le f(n) \le c' \cdot g(n)\}$

"The running time of merge sort is in $\Theta(n \log_2 n)$." " $f \in \Theta(n^2)$ with $f(n) = 3n^2 + 5n + 39$ "

or by convention (abusing notation/terminology) also

"The running time of merge sort is $\Theta(n \log_2 n)$." " $3n^2 + 5n + 39 = \Theta(n^2)$ "
