A2.1 Sets, Tuples, Relations

A2.2 Functions

A2.3 Summary

A2.1 Sets, Tuples, Relations

Sets

- set: unordered collection of distinguishable objects; each object contained at most once
- notations:
    - explicit, listing all elements, e. g. $A = \{1, 2, 3\}$
    - implicit, specifying a property characterizing all elements, e. g. $A = \{x \mid x \in \mathbb{N} \text{ and } 1 \leq x \leq 3\}$
    - implicit, as a sequence with dots, e. g. $\mathbb{Z} = \{\ldots, -2, -1, 0, 1, 2, \ldots\}$
- $e \in M$: e is in set M (an element of the set)
- $e \notin M$: e is not in set M
- empty set $\emptyset = \{\}$
- cardinality $|M|$ of a finite set M: number of elements in M

Sets

- ▶ $A \subseteq B$: A is a subset of B,
  i. e., every element of A is an element of B
- ▶ $A \subset B$: A is a strict subset of B,
  i. e., $A \subseteq B$ and $A \neq B$.
- ▶ power set $\mathcal{P}(M)$: set of all subsets of M
  e. g., $\mathcal{P}(\{a, b\}) =$
- ▶ Cardinality of power set of finite set S: $|\mathcal{P}(S)| =$

Set Operations

- ▶ intersection $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$

- ▶ union $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$

- ▶ difference $A \setminus B = \{x \mid x \in A \text{ and } x \notin B\}$

- ▶ complement $\overline{A} = B \setminus A$, where $A \subseteq B$ and
  B is the set of all considered objects (in a given context)

Tuples

- ▶ k-tuple: ordered sequence of k objects
- ▶ written $(o_1, \ldots, o_k)$ or $\langle o_1, \ldots, o_k \rangle$
- ▶ unlike sets, order matters ($\langle 1, 2 \rangle \neq \langle 2, 1 \rangle$)
- ▶ objects may occur multiple times in a tuple
- ▶ objects contained in tuples are called components
- ▶ terminology:
  - ▶ $k = 2$: (ordered) pair
  - ▶ $k = 3$: triple
- ▶ if k is clear from context (or does not matter),
  often just called tuple

Cartesian Product

- ▶ for sets $M_1, M_2, \ldots, M_n$, the Cartesian product
  $M_1 \times \cdots \times M_n$ is the set
  $M_1 \times \cdots \times M_n = \{\langle o_1, \ldots, o_n \rangle \mid o_1 \in M_1, \ldots, o_n \in M_n\}$.
- ▶ Example: $M_1 = \{a, b, c\}, M_2 = \{1, 2\}$,
  $M_1 \times M_2 = \{\langle a, 1 \rangle, \langle a, 2 \rangle, \langle b, 1 \rangle, \langle b, 2 \rangle, \langle c, 1 \rangle, \langle c, 2 \rangle\}$
- ▶ special case: $M^k = M \times \cdots \times M$ (k times)
- ▶ example with $M = \{1, 2\}$:
  $M^2 = \{\langle 1, 1 \rangle, \langle 1, 2 \rangle, \langle 2, 1 \rangle, \langle 2, 2 \rangle\}$

Relations

▶ an n-ary relation R over the sets $M_1, \ldots, M_n$
is a subset of their Cartesian product: $R \subseteq M_1 \times \cdots \times M_n$.

▶ example with $M = \{1, 2\}$:
$R_\leq \subseteq M^2$ as $R_\leq = \{\langle 1, 1 \rangle, \langle 1, 2 \rangle, \langle 2, 2 \rangle\}$

A2.2 Functions

Functions

Definition (Total Function)

A (total) function $f : D \to C$ (with sets D, C)
maps every value of its domain D
to exactly one value of its codomain C.

Example

▶ $square : \mathbb{Z} \to \mathbb{Z}$ with $square(x) = x^2$

▶ $add : \mathbb{N}_0^2 \to \mathbb{N}_0$ with $add(x, y) = x + y$

▶ $add_\mathbb{R} : \mathbb{R}^2 \to \mathbb{R}$ with $add_\mathbb{R}(x, y) = x + y$

Functions: Example

Example

Let $Q = \{q_0, q_1, q_2, q_{\text{accept}}, q_{\text{reject}}\}$ and $\Gamma = \{0, 1, \square\}$.

Define $\delta : (Q \setminus \{q_{\text{accept}}, q_{\text{reject}}\}) \times \Gamma \to Q \times \Gamma \times \{\mathsf{L}, \mathsf{R}\}$ by

δ	0	1	$\square$
q_0	$\langle q_0, 0, \mathsf{R} \rangle$	$\langle q_0, 1, \mathsf{R} \rangle$	$\langle q_1, \square, \mathsf{L} \rangle$
q_1	$\langle q_2, 1, \mathsf{L} \rangle$	$\langle q_1, 0, \mathsf{L} \rangle$	$\langle q_{\text{reject}}, 1, \mathsf{L} \rangle$
q_2	$\langle q_2, 0, \mathsf{L} \rangle$	$\langle q_2, 1, \mathsf{L} \rangle$	$\langle q_{\text{accept}}, \square, \mathsf{R} \rangle$

Then, e. g., $\delta(q_0, 1) = \langle q_0, 1, \mathsf{R} \rangle$

Partial Functions

Definition (Partial Function)

A partial function $f : X \rightarrow_p Y$ maps every value in X
to at most one value in Y.

If f does not map $x \in X$ to any value in Y,
then f is undefined for x.

Example

$f : \mathbb{N}_0 \times \mathbb{N}_0 \rightarrow_p \mathbb{N}_0$ with

$$f(x, y) = \begin{cases} x - y & \text{if } y \leq x \\ \text{undefined} & \text{otherwise} \end{cases}$$

A2.3 Summary

Summary

- **sets:** unordered, contain every element at most once
- **tuples:** ordered, can contain the same object multiple times
- **Cartesian product:** $M_1 \times \cdots \times M_n$ set of all n-tuples
  where the i-th component is in M_i
- **function** $f : X \rightarrow Y$ maps every value in X
  to exactly one value in Y
- **partial function** $g : X \rightarrow_p Y$ may be undefined
  for some values in X
