March 25, 2024 — B7. Regular Languages: Pumping Lemma

B7.1 Pumping Lemma

## Pumping Lemma: Motivation

You can show that a language is regular by specifying an appropriate grammar, finite automaton, or regular expression. How can you you show that a language is not regular?

- ▶ Direct proof that no regular grammar exists that generates the language → difficult in general
- ▶ Pumping lemma: use a necessary property that holds for all regular languages.

B7. Regular Languages: Pumping Lemma

Pumping Lemma

## Pumping Lemma

### Theorem (Pumping Lemma)

If L is a regular language then there is a number  $p \in \mathbb{N}$ (a pumping number for L) such that all words  $x \in L$  with |x| > pcan be split into x = uvw with the following properties:

- **1**  $|v| \ge 1$ ,
- $|uv| \leq p$ , and
- $uv^i w \in L$  for all  $i = 0, 1, 2, \ldots$

Question: what if L is finite?

B7. Regular Languages: Pumping Lemma

Pumping Lemma

## Pumping Lemma: Proof

### Theorem (Pumping Lemma)

If L is a regular language then there is a number  $p \in \mathbb{N}$ (a pumping number for L) such that all words  $x \in L$  with |x| > pcan be split into x = uvw with the following properties:

- **1**  $|v| \ge 1$ ,
- |uv| < p, and
- **3**  $uv^i w \in L$  for all i = 0, 1, 2, ...

#### Proof.

For regular L there exists a DFA  $M = \langle Q, \Sigma, \delta, q_0, E \rangle$  with  $\mathcal{L}(M) = L$ . We show that p = |Q| has the desired properties.

Consider an arbitrary  $x \in \mathcal{L}(M)$  with length  $|x| \geq |Q|$ . Including the start state, M visits |x| + 1 states while reading x. Because of |x| > |Q| at least one state has to be visited twice.

B7. Regular Languages: Pumping Lemma

Pumping Lemma

## Pumping Lemma: Proof

### Theorem (Pumping Lemma)

If L is a regular language then there is a number  $p \in \mathbb{N}$ (a pumping number for L) such that all words  $x \in L$  with |x| > pcan be split into x = uvw with the following properties:

- **1**  $|v| \ge 1$ ,
- |uv| < p, and
- $uv^iw \in L$  for all  $i = 0, 1, 2, \ldots$

### Proof (continued).

Choose a split x = uvw so M is in the same state after reading uand after reading uv. Obviously, we can choose the split in a way that  $|v| \ge 1$  and  $|uv| \le |Q|$  are satisfied.

B7. Regular Languages: Pumping Lemma

Pumping Lemma

## Pumping Lemma: Proof

### Theorem (Pumping Lemma)

If L is a regular language then there is a number  $p \in \mathbb{N}$ (a pumping number for L) such that all words  $x \in L$  with |x| > pcan be split into x = uvw with the following properties:

- **1**  $|v| \ge 1$ ,
- |uv| < p, and
- $uv^iw \in L$  for all  $i = 0, 1, 2, \ldots$

### Proof (continued).

The word v corresponds to a loop in the DFA after reading u and can thus be repeated arbitrarily often. Every subsequent continuation with w ends in the same end state as reading x.

Therefore  $uv^i w \in \mathcal{L}(M) = L$  is satisfied for all  $i = 0, 1, 2, \dots$

B7. Regular Languages: Pumping Lemma

Pumping Lemma

## Pumping Lemma: Caveat

#### Caveat:

The pumping lemma is a necessary condition for a language to be regular, but not a sufficient one.

- ★ there are languages that satisfy the pumping lemma conditions but are not regular
- → for such languages, other methods are needed to show that they are not regular (e.g., the Myhill-Nerode theorem)

## Pumping Lemma: Application

Using the pumping lemma (PL):

### Proof of Nonregularity

- ▶ If L is regular, then the pumping lemma holds for L.
- ▶ By contraposition: if the PL does not hold for L, then L cannot be regular.
- ▶ That is: if there is no  $p \in \mathbb{N}$  with the properties of the PL, then *L* cannot be regular.

Theory of Computer Science

Pumping Lemma

B7. Regular Languages: Pumping Lemma Pumping Lemma: Example

### Example

The language  $L = \{a^n b^n \mid n \in \mathbb{N}\}$  is not regular.

#### Proof.

Assume L is regular. Then let p be a pumping number for L.

The word  $x = a^p b^p$  is in L and has length  $\geq p$ .

Let x = uvw be a split with the properties of the PL.

Then the word  $x' = uv^2w$  is also in L. Since |uv| < p, uv consists only of symbols a and  $x' = a^{|u|}a^{2|v|}a^{p-|uv|}b^p = a^{p+|v|}b^p$ .

Since  $|v| \ge 1$  it follows that  $p + |v| \ne p$  and thus  $x' \notin L$ .

This is a contradiction to the PL.  $\rightsquigarrow L$  is not regular.

## Pumping Lemma: Another Example I

### Example

The language  $L = \{ab^nac^{n+2} \mid n \in \mathbb{N}\}$  is not regular.

#### Proof.

Assume L is regular. Then let p be a pumping number for L.

The word  $x = ab^pac^{p+2}$  is in L and has length  $\geq p$ .

Let x = uvw be a split with the properties of the PL.

From  $|uv| \le p$  and  $|v| \ge 1$  we know that uv consists of one a followed by at most p-1 bs.

We distinguish two cases, |u| = 0 and |u| > 0.

## Pumping Lemma: Another Example II

### Example

B7. Regular Languages: Pumping Lemma

The language  $L = \{ab^nac^{n+2} \mid n \in \mathbb{N}\}$  is not regular.

### Proof (continued).

If |u| = 0, then word v starts with an a.

Hence,  $uv^0w = b^{p-|v|+1}ac^{p+2}$  does not start with symbol a and is therefore not in L. This is a contradiction to the PL.

If |u| > 0, then word v consists only of bs.

Consider  $uv^0w = ab^{p-|v|}ac^{p+2}$ . As  $|v| \ge 1$ , this word does not contain two more cs than bs and is therefore not in language L. This is a contradiction to the PL.

We have in all cases a contradiction to the PL.

 $\rightsquigarrow$  L is not regular.

B7. Regular Languages: Pumping Lemma

Pumping Lemma

## Pumping Lemma: Exercise

### This was an exam question in 2020:

Use the pumping lemma to prove that  $L = \{a^m b^n \mid m \ge 0, n < m\}$  is not regular.

B7. Regular Languages: Pumping Lemma

## Summary

► The pumping lemma can be used to show that a language is not regular.
