Pumping Lemma

## Content of the Course

## Pumping Lemma: Motivation

You can show that a language is regular by specifying an appropriate grammar, finite automaton, or regular expression. How can you you show that a language is not regular?

## Pumping Lemma: Motivation

You can show that a language is regular by specifying an appropriate grammar, finite automaton, or regular expression. How can you you show that a language is not regular?

- Direct proof that no regular grammar exists that generates the language
$\rightsquigarrow$ difficult in general

## Pumping Lemma: Motivation

You can show that a language is regular by specifying an appropriate grammar, finite automaton, or regular expression. How can you you show that a language is not regular?

■ Direct proof that no regular grammar exists that generates the language
$\rightsquigarrow$ difficult in general
■ Pumping lemma: use a necessary property that holds for all regular languages.

## Pumping Lemma

## Theorem (Pumping Lemma)

If $L$ is a regular language then there is a number $p \in \mathbb{N}$ (a pumping number for $L$ ) such that all words $x \in L$ with $|x| \geq p$
can be split into $x=u v w$ with the following properties:
(1) $|v| \geq 1$,
(2) $|u v| \leq p$, and
(3) $u v^{i} w \in L$ for all $i=0,1,2, \ldots$.

Question: what if $L$ is finite?

## Pumping Lemma: Proof

Theorem (Pumping Lemma)
If $L$ is a regular language then there is a number $p \in \mathbb{N}$ (a pumping number for $L$ ) such that all words $x \in L$ with $|x| \geq p$
can be split into $x=u v w$ with the following properties:
(1) $|v| \geq 1$,
(2) $|u v| \leq p$, and
(3) $u v^{i} w \in L$ for all $i=0,1,2, \ldots$.

## Pumping Lemma: Proof

## Theorem (Pumping Lemma)

If $L$ is a regular language then there is a number $p \in \mathbb{N}$ (a pumping number for $L$ ) such that all words $x \in L$ with $|x| \geq p$
can be split into $x=u v w$ with the following properties:
(1) $|v| \geq 1$,
(2) $|u v| \leq p$, and
(3) $u v^{i} w \in L$ for all $i=0,1,2, \ldots$.

## Proof.

For regular $L$ there exists a DFA $M=\left\langle Q, \Sigma, \delta, q_{0}, E\right\rangle$ with $\mathcal{L}(M)=L$. We show that $p=|Q|$ has the desired properties.

## Pumping Lemma: Proof

## Theorem (Pumping Lemma)

If $L$ is a regular language then there is a number $p \in \mathbb{N}$ (a pumping number for $L$ ) such that all words $x \in L$ with $|x| \geq p$ can be split into $x=u v w$ with the following properties:
(1) $|v| \geq 1$,
(2) $|u v| \leq p$, and
(3) $u v^{i} w \in L$ for all $i=0,1,2, \ldots$.

## Proof.

For regular $L$ there exists a DFA $M=\left\langle Q, \Sigma, \delta, q_{0}, E\right\rangle$ with $\mathcal{L}(M)=L$. We show that $p=|Q|$ has the desired properties.
Consider an arbitrary $x \in \mathcal{L}(M)$ with length $|x| \geq|Q|$. Including the start state, $M$ visits $|x|+1$ states while reading $x$. Because of $|x| \geq|Q|$ at least one state has to be visited twice.

## Pumping Lemma: Proof

## Theorem (Pumping Lemma)

If $L$ is a regular language then there is a number $p \in \mathbb{N}$ (a pumping number for $L$ ) such that all words $x \in L$ with $|x| \geq p$ can be split into $x=u v w$ with the following properties:
(1) $|v| \geq 1$,
(2) $|u v| \leq p$, and
(3) $u v^{i} w \in L$ for all $i=0,1,2, \ldots$.

## Proof (continued).

Choose a split $x=u v w$ so $M$ is in the same state after reading $u$ and after reading $u v$. Obviously, we can choose the split in a way that $|v| \geq 1$ and $|u v| \leq|Q|$ are satisfied.

## Pumping Lemma: Proof

## Theorem (Pumping Lemma)

If $L$ is a regular language then there is a number $p \in \mathbb{N}$ (a pumping number for $L$ ) such that all words $x \in L$ with $|x| \geq p$ can be split into $x=u v w$ with the following properties:
(1) $|v| \geq 1$,
(2) $|u v| \leq p$, and
(3) $u v^{i} w \in L$ for all $i=0,1,2, \ldots$.

## Proof (continued).

The word $v$ corresponds to a loop in the DFA after reading $u$ and can thus be repeated arbitrarily often. Every subsequent continuation with $w$ ends in the same end state as reading $x$. Therefore $u v^{i} w \in \mathcal{L}(M)=L$ is satisfied for all $i=0,1,2, \ldots$

## Pumping Lemma: Application

Using the pumping lemma (PL):

## Proof of Nonregularity

■ If $L$ is regular, then the pumping lemma holds for $L$.

- By contraposition: if the PL does not hold for $L$, then $L$ cannot be regular.
- That is: if there is no $p \in \mathbb{N}$ with the properties of the PL , then $L$ cannot be regular.

## Pumping Lemma: Caveat

## Caveat:

The pumping lemma is a necessary condition for a language to be regular, but not a sufficient one.
$\rightsquigarrow$ there are languages that satisfy the pumping lemma conditions but are not regular
$\rightsquigarrow$ for such languages, other methods are needed to show that they are not regular (e.g., the Myhill-Nerode theorem)

## Pumping Lemma: Example

## Example

The language $L=\left\{a^{n} b^{n} \mid n \in \mathbb{N}\right\}$ is not regular.

## Proof.

Assume $L$ is regular. Then let $p$ be a pumping number for $L$.
The word $x=\mathrm{a}^{p} \mathrm{~b}^{p}$ is in $L$ and has length $\geq p$.
Let $x=u v w$ be a split with the properties of the PL.
Then the word $x^{\prime}=u v^{2} w$ is also in $L$. Since $|u v| \leq p, u v$ consists only of symbols a and $x^{\prime}=\mathrm{a}^{|u|} \mathrm{a}^{2|v|} \mathrm{a}^{p-|u v|} \mathrm{b}^{p}=\mathrm{a}^{p+|v|} \mathrm{b}^{p}$.
Since $|v| \geq 1$ it follows that $p+|v| \neq p$ and thus $x^{\prime} \notin L$.
This is a contradiction to the PL. $\rightsquigarrow L$ is not regular.

## Pumping Lemma: Another Example I

## Example

The language $L=\left\{\mathrm{ab}^{n} \mathrm{ac}^{n+2} \mid n \in \mathbb{N}\right\}$ is not regular.

## Proof.

Assume $L$ is regular. Then let $p$ be a pumping number for $L$.
The word $x=\mathrm{ab}^{p} \mathrm{ac}^{p+2}$ is in $L$ and has length $\geq p$.
Let $x=u v w$ be a split with the properties of the PL.
From $|u v| \leq p$ and $|v| \geq 1$ we know that $u v$ consists of one a followed by at most $p-1$ bs.
We distinguish two cases, $|u|=0$ and $|u|>0$.

## Pumping Lemma: Another Example II

## Example

The language $L=\left\{\mathrm{ab}^{n} \mathrm{ac}^{n+2} \mid n \in \mathbb{N}\right\}$ is not regular.

## Proof (continued).

If $|u|=0$, then word $v$ starts with an a.
Hence, $u v^{0} w=\mathrm{b}^{p-|v|+1} \mathrm{ac}^{p+2}$ does not start with symbol a and is therefore not in $L$. This is a contradiction to the PL.
If $|u|>0$, then word $v$ consists only of bs.
Consider $u v^{0} w=\mathrm{ab}^{p-|v|} \mathrm{ac}^{p+2}$. As $|v| \geq 1$, this word does not contain two more cs than bs and is therefore not in language $L$. This is a contradiction to the PL.

We have in all cases a contradiction to the PL.
$\rightsquigarrow L$ is not regular.

## Pumping Lemma: Exercise

This was an exam question in 2020:
Use the pumping lemma to prove that
$L=\left\{a^{m} b^{n} \mid m \geq 0, n<m\right\}$ is not regular.

## Questions

## Questions?

## Summary

## Summary

- The pumping lemma can be used to show that a language is not regular.
