Pumping Lemma

Decidability 0000000000 Summary 000

Pumping Lemma for Context-free Languages

We used the pumping lemma from chapter B7 to show that a language is not regular. Is there a similar lemma for context-free languages?

Pumping Lemma for Context-free Languages

We used the pumping lemma from chapter B7 to show that a language is not regular. Is there a similar lemma for context-free languages?

Yes!

Pumping Lemma for Context-free Languages

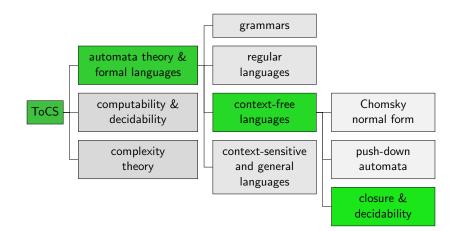

Pumping lemma for context-free languages:

- It is possible to prove a variant of the pumping lemma for context-free languages.
- Pumping is more complex than for regular languages:
 - word is decomposed into the form uvwxywith $|vx| \ge 1$, $|vwx| \le p$
 - pumped words have the form uvⁱwxⁱy
- This allows us to prove that certain languages are not context-free.
- example: {aⁿbⁿcⁿ | n ≥ 1} is not context-free (we will later use this without proof)

Closure Properties

Content of the Course

Summary 000

Closure under Union, Concatenation, Star

Theorem

The context-free languages are closed under:

- union
- concatenation
- star

. . .

Closure under Union, Concatenation, Star: Proof

Proof.

Closed under union:

Let $G_1 = \langle V_1, \Sigma_1, R_1, S_1 \rangle$ and $G_2 = \langle V_2, \Sigma_2, R_2, S_2 \rangle$ be context-free grammars. W.I.o.g., $V_1 \cap V_2 = \emptyset$. Then $\langle V_1 \cup V_2 \cup \{S\}, \Sigma_1 \cup \Sigma_2, R_1 \cup R_2 \cup \{S \to S_1, S \to S_2\}, S \rangle$ (where $S \notin V_1 \cup V_2$) is a context-free grammar for $\mathcal{L}(G_1) \cup \mathcal{L}(G_2)$.

. . .

Closure under Union, Concatenation, Star: Proof

Proof (continued).

Closed under concatenation:

Let $G_1 = \langle V_1, \Sigma_1, R_1, S_1 \rangle$ and $G_2 = \langle V_2, \Sigma_2, R_2, S_2 \rangle$ be context-free grammars. W.I.o.g., $V_1 \cap V_2 = \emptyset$. Then $\langle V_1 \cup V_2 \cup \{S\}, \Sigma_1 \cup \Sigma_2, R_1 \cup R_2 \cup \{S \to S_1S_2\}, S \rangle$ (where $S \notin V_1 \cup V_2$) is a context-free grammar for $\mathcal{L}(G_1)\mathcal{L}(G_2)$.

Closure under Union, Concatenation, Star: Proof

Proof (continued).

Closed under star:

Let $G = \langle V, \Sigma, R, S \rangle$ be a context-free grammar where w.l.o.g. S never occurs on the right-hand side of a rule. Then $G' = \langle V \cup \{S'\}, \Sigma, R', S' \rangle$ with $S' \notin V$ and $R' = R \cup \{S' \rightarrow \varepsilon, S' \rightarrow S, S' \rightarrow SS'\}$ is a context-free grammar for $\mathcal{L}(G)^*$.

Decidability 0000000000 Summary 000

No Closure under Intersection or Complement

Theorem

The context-free languages are not closed under:

- intersection
- complement

No Closure under Intersection or Complement: Proof

Proof.

Not closed under intersection:

The languages
$$L_1 = \{a^i b^j c^j \mid i, j \ge 1\}$$

and $L_2 = \{a^i b^j c^i \mid i, j \ge 1\}$ are context-free.

• For example,
$$G_1 = \langle \{S, A, X\}, \{a, b, c\}, R, S \rangle$$
 with $R = \{S \rightarrow AX, A \rightarrow a, A \rightarrow aA, X \rightarrow bc, X \rightarrow bXc\}$ is a context-free grammar for L_1 .

• For example,
$$G_2 = \langle \{S, B\}, \{a, b, c\}, R, S \rangle$$
 with $R = \{S \rightarrow aSc, S \rightarrow B, B \rightarrow b, B \rightarrow bB\}$ is a context-free grammar for L_2 .

Their intersection is $L_1 \cap L_2 = \{a^n b^n c^n \mid n \ge 1\}$. We have remarked before that this language is not context-free.

. . .

No Closure under Intersection or Complement: Proof

Proof (continued).

Not closed under complement:

By contradiction: assume they were closed under complement.

Then they would also be closed under intersection because they are closed under union and

$$L_1 \cap L_2 = \overline{\overline{L_1} \cup \overline{L_2}}.$$

This is a contradiction because we showed that they are not closed under intersection.

Summary 000

Decidability

Decidability 0000000000

Word Problem

Definition (Word Problem for Context-free Languages)

The word problem P_{\in} for context-free languages is:

Given: context-free grammar G with alphabet Σ and word $w \in \Sigma^*$ Question: Is $w \in \mathcal{L}(G)$?

Decidability: Word Problem

Theorem

The word problem P_{\in} for context-free languages is decidable.

Proof.

If $w = \varepsilon$, then $w \in \mathcal{L}(G)$ iff $S \to \varepsilon$ with start variable S is a rule of G.

Since for all other rules $w_{l} \rightarrow w_{r}$ of *G* we have $|w_{l}| \leq |w_{r}|$, the intermediate results when deriving a non-empty word never get shorter.

So it is possible to systematically consider all (finitely many) derivations of words up to length |w| and test whether they derive the word w.

Note: This is a terribly inefficient algorithm.

Emptiness Problem

Definition (Emptiness Problem for Context-free Languages)

The emptiness problem P_{\emptyset} for context-free languages is:

Given: context-free grammar G Question: Is $\mathcal{L}(G) = \emptyset$?

Decidability: Emptiness Problem

Theorem

The emptiness problem for context-free languages is decidable.

Proof.

Given a grammar G, determine all variables in G that allow deriving words that only consist of terminal symbols:

- First mark all variables A for which a rule A → w exists such that w only consists of terminal symbols or w = ε.
- Then mark all variables A for which a rule A → w exists such that all nonterminal systems in w are already marked.
- Repeat this process until no further markings are possible. $\mathcal{L}(G)$ is empty iff the start variable is unmarked at the end of this process.

Finiteness Problem

Definition (Finiteness Problem for Context-free Languages)

The finiteness problem P_{∞} for context-free languages is:

Given: context-free grammar G Question: Is $|\mathcal{L}(G)| < \infty$?

Decidability: Finiteness Problem

Theorem

The finiteness problem for context-free languages is decidable.

We omit the proof. A possible proof uses the pumping lemma for context-free languages.

Proof sketch:

- We can compute certain bounds *I*, *u* ∈ N₀ for a given context-free grammar *G* such that *L*(*G*) is infinite iff there exists *w* ∈ *L*(*G*) with *I* ≤ |*w*| ≤ *u*.
- Hence we can decide finiteness by testing all (finitely many) such words by using an algorithm for the word problem.

Intersection Problem

Definition (Intersection Problem for Context-free Languages)

The intersection problem $P_{\ensuremath{\cap}}$ for context-free languages is:

Given:	context-free grammars G and G'
Question:	Is $\mathcal{L}(G)\cap\mathcal{L}(G')=\emptyset$?

Decidability 000000000000

Equivalence Problem

Definition (Equivalence Problem for Context-free Languages)

The equivalence problem $P_{=}$ for context-free languages is:

Given: context-free grammars G and G' Question: Is $\mathcal{L}(G) = \mathcal{L}(G')$?

Undecidability: Equivalence and Intersection Problem

Theorem

The equivalence problem for context-free languages and the intersection problem for context-free languages are not decidable.

We cannot show this with the means currently available, but we will get back to this in Part C (computability theory).

Decidability 0000000000 Summary •00

Summary

Summary

- The context-free languages are closed under union, concatenation and star.
- The context-free languages are not closed under intersection or complement.
- The word problem, emptiness problem and finiteness problem for the class of context-free languages are decidable.
- The equivalence problem and intersection problem for the class of context-free languages are not decidable.

Further Topics on Context-free Languages and PDAs

- With the CYK-algorithm (Cocke, Younger and Kasami) it is possible to decide w ∈ L(G) in time O(|w|³) for a grammar in Chomsky normal form and a word w.
- Deterministic push-down automata have the restriction $|\delta(q, a, A)| + |\delta(q, \varepsilon, A)| \le 1$ for all $q \in Q, a \in \Sigma, A \in \Gamma$.
- The languages recognized by deterministic PDAs are called deterministic context-free languages. They form a strict superset of the regular languages and a strict subset of the context-free languages.
