### Content of the Course

### Automata for Type-1 and Type-0 Languages?

Finite automata recognize exactly the regular languages, push-down automata exactly the context-free languages. Are there automata models for context-sensitive and type-0 languages?

#### Yes! ~ Turing machines

# Alan Turing (1912–1954)

Picture courtesy of Jon Callas / wikimedia commons

- British logician, mathematician, cryptanalyst and computer scientist
- most important work (for us): On Computable Numbers, with an Application to the Entscheidungsproblem
  Turing machines
- collaboration on Enigma decryption
- conviction due to homosexuality; pardoned by Elizabeth II in Dec. 2013
- Turing award most important science award in computer science

### Turing Machines: Conceptually

# Turing Machine: Definition

# Turing Machine: Transition Function

Let 
$$M = \langle Q, \Sigma, \Gamma, \delta, q_0, q_{\mathsf{accept}}, q_{\mathsf{reject}} \rangle$$
 be a DTM.

What is the Intuitive Meaning of the Transition Function  $\delta$ ?  $\delta(q, a) = \langle q', b, D \rangle$ :

- ▶ If *M* is in state *q* and reads *a*, then
- M transitions to state q' in the next step,
- replacing a with b,
- ▶ and moving the head in direction  $D \in \{L, R\}$ , where:
  - R: one step to the right,
  - L: one step to the left, except if the head is on the left-most cell of the tape in which case there is no movement

$$(q) \xrightarrow{a \to b, D} (q')$$

### Deterministic Turing Machine: Example

 $\langle \{q_1, \dots, q_5, q_{\mathsf{accept}}, q_{\mathsf{reject}} \}, \{0\}, \{0, \mathbf{x}, \Box\}, \delta, q_1, q_{\mathsf{accept}}, q_{\mathsf{reject}} \rangle$ 

## Turing Machine: Configuration

Definition (Configuration of a Turing Machine) A configuration of a Turing machine  $M = \langle Q, \Sigma, \Gamma, \delta, q_0, q_{\text{accept}}, q_{\text{reject}} \rangle$ is given by a triple  $c \in \Gamma^* \times Q \times \Gamma^+$ .

Configuration  $\langle w_1, q, w_2 \rangle$  intuitively means that

- the non-empty or already visited part of the tape contains the word w<sub>1</sub>w<sub>2</sub>,
- the read-write head is on the first symbol of  $w_2$ , and
- ▶ the TM is in state q.

### Turing Machine Configurations: Example

# Turing Machine Configurations: Start Configuration

#### Initially

- the TM is in start state q<sub>0</sub>,
- the head is on the first tape cell, and
- ► the tape contains the input word w followed by an infinite number of □ entries.

The corresponding start configuration is  $\langle \varepsilon, q_0, w \rangle$  if  $w \neq \varepsilon$ and  $\langle \varepsilon, q_0, \Box \rangle$  if  $w = \varepsilon$ .

# Turing Machine: Step

Definition (Transition/Step of a Turing Machine) A DTM  $M = \langle Q, \Sigma, \Gamma, \delta, q_0, q_{\text{accept}}, q_{\text{reject}} \rangle$  transitions from configuration c to configuration c' in one step  $(c \vdash_M c')$ according to the following rules:  $\blacktriangleright$   $\langle a_1 \dots a_m, q, b_1 \dots b_n \rangle \vdash_M \langle a_1 \dots a_m c, q', b_2 \dots b_n \rangle$ if  $\delta(q, b_1) = \langle q', c, \mathsf{R} \rangle, m > 0, n > 2$  $\blacktriangleright$   $\langle a_1 \dots a_m, q, b_1 \rangle \vdash_M \langle a_1 \dots a_m c, q', \Box \rangle$ if  $\delta(a, b_1) = \langle q', c, \mathsf{R} \rangle, m > 0$  $\blacktriangleright \langle a_1 \dots a_m, q, b_1 \dots b_n \rangle \vdash_M \langle a_1 \dots a_{m-1}, q', a_m c b_2 \dots b_n \rangle$ if  $\delta(q, b_1) = \langle q', c, L \rangle, m > 1, n > 1$  $\blacktriangleright \langle \varepsilon, q, b_1 \dots b_n \rangle \vdash_M \langle \varepsilon, q', cb_2 \dots b_n \rangle$ if  $\delta(q, b_1) = \langle q', c, L \rangle, n > 1$ 

# Step: Exercise (Slido)

### DTM: Accepted Words

Intuitively, a DTM accepts a word if its computation terminates in the accept state.

Definition (Words Accepted by a DTM) DTM  $M = \langle Q, \Sigma, \Gamma, \delta, q_0, q_{accept}, q_{reject} \rangle$  accepts the word  $w = a_1 \dots a_n$  if there is a sequence of configurations  $c_0, \dots, c_k$  with  $c_0$  is the start configuration of M on input w,  $c_i \vdash_M c_{i+1}$  for all  $i \in \{0, \dots, k-1\}$ , and  $c_k$  is an accepting configuration, i.e., a configuration with state  $q_{accept}$ .

### Accepted Word: Example (Slido)

Does this Turing machine accept input 0000?

# DTM: Recognized Language

Definition (Language Recognized by a DTM) Let M be a deterministic Turing Machine The language recognized by M (or the language of M) is defined as  $\mathcal{L}(M) = \{w \in \Sigma^* \mid w \text{ is accepted by } M\}.$ 

Definition (Turing-recognizable Language) We call a language Turing-recognizable if some deterministic Turing machine recognizes it.

### Turing Machine: Example

- Sweep left to right across the tape, crossing off every other 0.
- If in stage 1 the tape contained a single 0, accept.
- If in stage 1 the tape contained more than one 0 and the number of 0s was odd, reject.
- Return the head to the left end of the tape and go to stage 1.

### Recognized Language: Example

#### What language does the Turing machine recognize?

Gabriele Röger (University of Basel)

Theory of Computer Science

### Deciders

A Turing machine either fails to accept an input

- because it rejects it (entering q<sub>reject</sub>) or
- because it loops (= does not halt).
- A Turing machine that halts on all inputs (entering q<sub>reject</sub> or q<sub>accept</sub>) is called a decider.

A decider that recognizes some language also is said to decide the language.

# Definition (Turing-decidable Language)

We call a language Turing-decidable (or decidable) if some deterministic Turing machine decides it.

B11. Turing Machines I

Turing Machines

# Exercise (if time)

Specify the state diagram of a DTM that decides language

$$L = \{ w \# w \mid w \in \{0,1\}^* \}.$$

Feel free to solve this together with your neighbour.

# B11.2 Summary

## Summary

- Turing machines only have finitely many states but an unbounded tape as "memory".
- Alan Turing proposed them as a mathematical model for arbitrary algorithmic computations.
- In this role, we will revisit them in the parts on computability and complexity theory.
