A1. Organizational Matters

Students

target audience:

- ▶ Bachelor Computer Science, ~3rd year
- ► Bachelor Computational Sciences, ~3rd year
- ► Master Data Science
- other students welcome

prerequisites:

M. Helmert (University of Basel)

- ► algorithms and data structures
- basic mathematical concepts
 (formal proofs; sets, functions, relations, graphs)
- complexity theory
- programming skills (mainly for exercises)

Foundations of Artificial Intelligence

Structure Overview

Foundations of Al week structure:

Wednesday: exercise sessionSunday: exercise sheet dueexceptions due to holidays

Monday: release of exercise sheetMonday and Wednesday: lectures

Foundations of Artificial Intelligence

February 17, 2025

10 / 26

A1. Organizational Matters

Time & Place

Lectures

- ▶ Mon 16:15–18:00 in Biozentrum, lecture hall U1.141
- ▶ Wed 14:15–16:00 in Biozentrum, lecture hall U1.141

Exercise Sessions

- ▶ Wed 16:15–18:00 in Biozentrum, SR U1.195
- ► Fri 10:15–12:00 in Spiegelgasse 1, room U1.001 (changed)

first exercise session: February 19 (this week)

A1. Organizational Matters

Exercises

exercise sheets (homework assignments):

- mostly theoretical exercises
- occasional programming exercises

exercise sessions:

- ▶ initial part:
 - ▶ discuss common mistakes in previous exercise sheet
 - answer questions on previous exercise sheet
- main part:

M. Helmert (University of Basel)

- we support you solving the current exercise sheet
- we answer your questions
- we assist you comprehend the course content

M. Helmert (University of Basel) Foundations of Artificial Intelligence February 17, 2025 11 / 26

Foundations of Artificial Intelligence

February 17, 2025

12 / 2

Theoretical Exercises

theoretical exercises:

- exercises on ADAM every Monday
- covers material of that week (Monday and Wednesday)
- ▶ due Sunday of the same week (23:59) via ADAM
- \triangleright solved in groups of at most two (2 = 2)
- support in exercise session of current week
- discussed in exercise session of following week

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

February 17, 2025

A1. Organizational Matters

A1 3 Assessment

A1. Organizational Matters

Programming Exercises

programming exercises (project):

- project with 3–4 parts over the duration of the semester
- ▶ integrated into the exercise sheets (no special treatment)
- \triangleright solved in groups of at most two (2 < 3)
- implemented in Java; need working Linux system for some
- solutions that obviously do not work: 0 marks

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Course Material

A1. Organizational Matters

course material that is relevant for the exam:

- slides
- content of lecture
- exercise sheets

additional (optional) course material:

- textbook
- bonus material

Textbook

Artificial Intelligence: A Modern Approach by Stuart Russell and Peter Norvig

(4th edition, Global edition)

covers large parts of the course (and much more), but not everything

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Exam

written exam on Wednesday, July 2

- **1**4:00-16:00
- ▶ 105 minutes for working on the exam
- location: Biozentrum, lecture hall U1.131
- ▶ 8 ECTS credits
- ▶ admission to exam: 50% of the exercise marks
- class participation not required but highly recommended
- no repeat exam

M. Helmert (University of Basel)

Plagiarism

Plagiarism (Wikipedia)

Plagiarism is the "wrongful appropriation" and "stealing and publication" of another author's "language, thoughts, ideas, or expressions" and the representation of them as one's own original work.

consequences:

- ▶ 0 marks for the exercise sheet (first time)
- exclusion from exam (second time)

if in doubt: check with us what is (and isn't) OK before submitting exercises too difficult? Join the exercise session!

A1. Organizational Matters About this Course

Topic Selection

guidelines for topic selection:

- ► fewer topics, more depth
- ► more emphasis on programming projects
- connections between topics
- avoiding overlap with other courses
 - ► Pattern Recognition (B.Sc.)
 - ► Machine Learning (M.Sc.)
- ▶ focus on algorithmic core of model-based Al

Thinking Like Humans

Cognitive (Neuro-) Science

- requires knowledge of how humans think
- two ways to a scientific theory of brain activity:
 - psychological: observation of human behavior
 - neurological: observation of brain activity

- roughly corresponds to cognitive science and cognitive neuroscience
- ► today separate research areas from Al

Eliza 1s a mock Rogerian psychotherapist.
The original program was described by Joseph Welzenbaum in 1966.
This implementation by Morbert Landsteiner 2005.

ELIZA: Can see this connection, do you suppose ?
YOU: They're always bugging us about something or other.
ELIZA: Can you think of a specific example ?
YOU: Well, my boyfriend made me come here.
FILTA: The Important to you that your boyfriend made you come here ?
YOU: Be says I'm depressed much of the time.

ELIZA: Can you explain what made you unhappy?

- developed in 1966 by J. Weizenbaum
- uses combination of pattern matching and scripted rules
- ► most famous script mimics a psychologist \leadsto many questions
- fooled early users

A2. Introduction: What is Artificial Intelligence?

Turing Test: Brief History

- Eliza
- Loebner Prize
- Eugene Goostman
- Kuki (formerly Mitsuku)
- ► Google Duplex
- ► LaMDA & ChatGPT

- ▶ annual competition between 1991–2019
- most human-like AI is awarded
- highly controversial

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

Turing Test: Brief History

- Eliza
- Loebner Prize
- ► Eugene Goostman
- Kuki (formerly Mitsuku)
- ► Google Duplex
- ► LaMDA & ChatGPT

- mimics a 13-year-old boy from Odessa, Ukraine with a guinea pig
- "not too old to know everything and not too young to know nothing"
- ▶ 33% of judges were convinced it was human in 2014 → first system that passed the Turing test (?)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

Acting Like Humans

Turing Test: Brief History

- Eliza
- Loebner Prize
- Eugene Goostman
- Kuki (formerly Mitsuku)

A2. Introduction: What is Artificial Intelligence?

- Google Duplex
- LaMDA & ChatGPT

- five times winner of Loebner prize competitions (2015-2019)
- winner of "bot battle" versus Facebook's Blenderbot → https://youtu.be/RBK5j0yXDT8

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

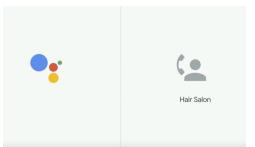

28 / 38

Acting Like Humans

A2. Introduction: What is Artificial Intelligence?

Turing Test: Brief History

- ▶ Eliza
- ► Loebner Prize
- Eugene Goostman
- Kuki (formerly Mitsuku)
- ► Google Duplex
- ► LaMDA & ChatGPT

- commercial product announced in 2018
- performs phone calls (making appointments) fully autonomously
- ▶ after criticism, it now starts conversation by identifying as a robot

A2. Introduction: What is Artificial Intelligence?

Turing Test: Brief History

- ► Eliza
- Loebner Prize
- Eugene Goostman
- Kuki (formerly Mitsuku)
- ► Google Duplex
- ► LaMDA & ChatGPT

- systems like LaMDA and ChatGPT would likely pass the Turing test
- example conversation: https://www.nytimes.com/2023/02/16/ technology/bing-chatbot-transcript.html
- ► ChatGPT even passed some exams (but failed on others)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence February 17, 2025

Value of the Turing Test

- human actions not always intelligent
- scientific value of Turing test questionable:
 - ► Test for AI or for interrogator?
 - results not reproducible
 - ► strategies to succeed ≠ intelligence:
 - deceive interrogator
 - mimic human behavior

 \rightsquigarrow not important in Al "mainstream"

practical application: CAPTCHA ("Completely Automated Public Turing test to tell Computers and Humans Apart")

M. Helmert (University of Basel)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

TURING TEST EXTRA CREDIT: CONVINCE THE EXAMINER

THAT HE'S A COMPUTER.

YOU KNOW, YOU MAKE SOME REALLY GOOD POINTS.

I'M ... NOT EVEN SURE

M. Helmert (University of Basel)

A2. Introduction: What is Artificial Intelligence?

A2. Introduction: What is Artificial Intelligence?

What Do We Mean by Artificial Intelligence?

thinking like humans

acting like humans

Thinking Rationally

February 17, 2025

Thinking Rationally: Laws of Thought

M. Helmert (University of Basel)

► Aristotle: What are correct arguments and modes of thought?

thinking rationally

acting rationally

- > syllogisms: structures for arguments that always yield correct conclusions given correct premises:
 - Socrates is a human.

Foundations of Artificial Intelligence

- All humans are mortal.
- Therefore Socrates is mortal.
- direct connection to modern AI via mathematical logic

A2. Introduction: What is Artificial Intelligence?

Thinking Rationally

A2.4 Thinking Rationally

Foundations of Artificial Intelligence February 17, 2025 Foundations of Artificial Intelligence February 17, 2025

Problems of the Logical Approach

not all intelligent behavior stems from logical thinking and formal reasoning

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

A2. Introduction: What is Artificial Intelligence?

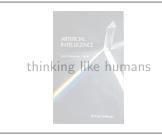

Acting Rationally

A2.5 Acting Rationally

A2. Introduction: What is Artificial Intelligence?

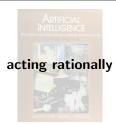

Thinking Rationally

What Do We Mean by Artificial Intelligence?

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

A2. Introduction: What is Artificial Intelligence?

Acting Rationally

Acting Rationally

acting rationally: "doing the right thing"

- ► the right thing: maximize utility given available information
- does not necessarily require "thought" (e.g., reflexes)

advantages of AI as development of rational agents:

- ► more general than thinking rationally (logical inference only one way to obtain rational behavior)
- better suited for scientific method than approaches based on human thinking and acting
- → most common view of AI scientists today
- what we use in this course

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

A2. Introduction: What is Artificial Intelligence?

A2.6 Summary

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 17, 2025

A2. Introduction: What is Artificial Intelligence?

Summary

What is Al? → many possible definitions

- guided by humans vs. by utility (rationality)
- based on externally observable actions or inner thoughts?
- → four combinations:
 - ▶ acting like humans: e.g., Turing test
 - thinking like humans: cf. cognitive (neuro-)science
 - thinking rationally: logic
 - acting rationally: most common view today
 - → amenable to scientific method
 - → used in this course

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 19, 2025

A3. Introduction: AI Past and Present

Where are We Today?

Al Approaching Maturity

Russell & Norvig (1995)

Gentle revolutions have occurred in robotics, computer vision, machine learning, and knowledge representation.

A better understanding of the problems and their complexity properties, combined with increased mathematical sophistication, has led to workable research agendas and robust methods.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 19, 2025

A3. Introduction: Al Past and Present

Where are We Today?

Where are We Today?

- many coexisting paradigms
 - reactive vs. deliberative
 - data-driven vs. model-driven
 - often hybrid approaches
- many methods, often borrowing from other research areas
 - ▶ logic, decision theory, statistics, . . .
- different approaches
 - theoretical
 - ► algorithmic/experimental
 - application-oriented

A3. Introduction: AI Past and Present

Where are We Today?

Focus on Algorithms and Experiments

Many AI problems are inherently difficult (NP-hard), but strong search techniques and heuristics often solve large problem instances regardless:

- satisfiability in propositional logic
 - ▶ 10,000 propositional variables or more via conflict-directed clause learning
- constraint solvers
 - good scalability via constraint propagation and automatic exploitation of problem structure
- action planning
 - ▶ 10¹⁰⁰ search states and more by search using automatically inferred heuristics

A4. Introduction: Rational Agents

Rationality

Rationality

rationality of an agent depends on performance measure (often: utility, reward, cost) and environment

Perfect Rationality

- ► for each possible observation sequence
- select an action which maximizes
- expected value of future performance
- ▶ given available information on observation history
- ▶ and environment

A4. Introduction: Rational Agents

Rationality

Perfect Rationality of Our Vacuum Agent

Is our vacuum agent perfectly rational?

depends on performance measure and environment, e.g.:

- ▶ Do actions reliably have the desired effect?
- ▶ Do we know the initial situation?
- ► Can new dirt be produced while the agent is acting?

M. Helmert (University of Basel) Foundations of Artificial Intelligence February 19, 2025 19

A4. Introduction: Rational Agents

A4.4 Summary

M. Helmert (University of Basel)

A4. Introduction: Rational Agents

Rationality: Discussion

 \triangleright perfect rationality \neq omniscience

reduces achievable utility

perfect rationality is rarely achievable

incomplete information (due to limited observations)

uncertain behavior of environment (e.g., stochastic

▶ limited computational power → bounded rationality

ightharpoonup perfect rationality \neq perfect prediction of future

action effects) reduces achievable utility

A4. Introduction: Rational Agents

Summary (1)

common metaphor for Al systems: rational agents

agent interacts with environment:

- sensors perceive observations about state of the environment
- actuators perform actions modifying the environment
- ► formally: agent function maps observation sequences to actions

A5. Introduction: Environments and Problem Solving Methods

Problem Solving Methods

Three Approaches to Solving AI Problems

We can solve a concrete Al problem (e.g., backgammon) in several ways:

Problem Solving Methods

- problem-specific: implement algorithm tailored to problem
- 2 general: create problem description as input for general solver
- 3 learning: learn (aspects of) algorithm from data

problem-specific algorithms:

- designed to solve a specific problem
- ► allow exploiting problem-specific knowledge
- ► solve just one (type of) problem

A5. Introduction: Environments and Problem Solving Methods

Problem Solving Methods

Three Approaches to Solving Al Problems

We can solve a concrete Al problem (e.g., backgammon) in several ways:

Problem Solving Methods

- problem-specific: implement algorithm tailored to problem
- 2 general: create problem description as input for general solver
- 3 learning: learn (aspects of) algorithm from data

general problem solvers:

- user creates model of problem instance in formalism ("language")
- solver takes modeled instance as input
- solver implements general algorithm to compute solution

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Problem Solving Methods

Three Approaches to Solving Al Problems

We can solve a concrete Al problem (e.g., backgammon) in several ways:

Problem Solving Methods

- problem-specific: implement algorithm tailored to problem
- 2 general: create problem description as input for general solver
- learning: learn (aspects of) algorithm from data

learners:

- general approach that learns to solve specific problem
- ▶ adapts via experience instead of via reasoning
- requires data and feedback instead of model of the Al problems

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

State-Space Search Problems

Informal Description

State-space search problems are among the "simplest" and most important classes of AI problems.

objective of the agent:

- apply a sequence of actions
- ► that reaches a goal state
- ► from a given initial state

performance measure: minimize total action cost

M. Helmert (University of Basel) Foundations of Artificial Intelligence February 24, 2025

B1. State-Space Search: State Spaces

Formalization

State Spaces

Definition (state space)

A state space or transition system is a 6-tuple $S = \langle S, A, cost, T, s_I, S_G \rangle$ with

- ► finite set of states *S*
- ► finite set of actions *A*
- ightharpoonup action costs $cost: A \to \mathbb{R}_0^+$
- ▶ transition relation $T \subseteq S \times A \times S$ that is deterministic in $\langle s, a \rangle$ (see next slide)
- ▶ initial state $s_1 \in S$
- ▶ set of goal states $S_G \subseteq S$

German: Zustandsraum, Transitionssystem, Zustände, Aktionen, Aktionskosten, Transitions-/Übergangsrelation, deterministisch, Anfangszustand, Zielzustände

B1. State-Space Search: State Spaces

Formalization

State Spaces: Terminology & Notation

Definition (transition, deterministic)

Let $S = \langle S, A, cost, T, s_I, S_G \rangle$ be a state space.

The triples $\langle s, a, s' \rangle \in T$ are called (state) transitions.

We say S has the transition $\langle s, a, s' \rangle$ if $\langle s, a, s' \rangle \in T$.

We write this as $s \xrightarrow{a} s'$, or $s \rightarrow s'$ when a does not matter.

Transitions are deterministic in $\langle s, a \rangle$: it is forbidden to have both $s \xrightarrow{a} s_1$ and $s \xrightarrow{a} s_2$ with $s_1 \neq s_2$.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

State Space: Running Example

Consider the bounded inc-and-square search problem.

informal description:

- find a sequence of
 - ▶ increment-mod10 (inc) and
 - square-mod10 (sqr) actions
- lacktriangledown on the natural numbers from 0 to 9 lacktriangledown cost(inc) = cost(sqr) = 1
- ▶ that reaches the number 6 or 7
- > starting from the number 1
- assuming each action costs 1.

formal model:

- $S = \{0, 1, \dots, 9\}$
- $ightharpoonup A = \{inc, sqr\}$
- ► T s.t. for i = 0, ..., 9:
 - $ightharpoonup \langle i, inc, (i+1) \mod 10 \rangle \in T$
 - $\triangleright \langle i, sqr, i^2 \mod 10 \rangle \in T$
- $ightharpoonup s_1 = 1$
- $S_G = \{6, 7\}$

M. Helmert (University of Basel)

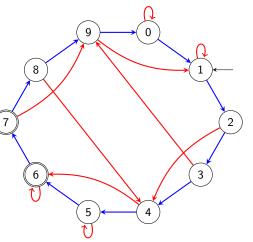

Foundations of Artificial Intelligence

February 24, 2025

Graph Interpretation

state spaces are often depicted as directed, labeled graphs

- states: graph vertices
- transitions: labeled arcs (here: colors instead of labels)
- ▶ initial state: incoming arrow
- goal states: double circles
- actions: the arc labels
- action costs: described separately (or implicitly = 1)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 24, 2025

B1. State-Space Search: State Spaces

State Spaces: More Terminology (1)

We use common terminology from graph theory.

Definition (predecessor, successor, applicable action)

Let $S = \langle S, A, cost, T, s_1, S_G \rangle$ be a state space.

Let $s, s' \in S$ be states with $s \to s'$.

- \triangleright s is a predecessor of s'
- \triangleright s' is a successor of s

If $s \stackrel{a}{\rightarrow} s'$, then action a is applicable in s.

German: Vorgänger, Nachfolger, anwendbar

B1. State-Space Search: State Spaces

State Spaces: More Terminology (2)

Definition (path)

Let $S = \langle S, A, cost, T, s_I, S_G \rangle$ be a state space.

Let $s_0, \ldots, s_n \in S$ be states and $a_1, \ldots, a_n \in A$ be actions such that $s_0 \xrightarrow{a_1} s_1, \ldots, s_{(n-1)} \xrightarrow{a_n} s_n$.

- $ightharpoonup \pi = \langle a_1, \ldots, a_n \rangle$ is a path from s_0 to s_n
- length of π : $|\pi| = n$
- ightharpoonup cost of π : $cost(\pi) = \sum_{i=1}^{n} cost(a_i)$

German: Pfad, Länge, Kosten

- paths may have length 0
- \triangleright sometimes "path" is used for state sequence $\langle s_0, \ldots, s_n \rangle$ or sequence $\langle s_0, a_1, s_1, \dots, s_{(n-1)}, a_n, s_n \rangle$

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 24, 2025

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Formalization

State Spaces: More Terminology (3)

More terminology:

Definition (reachable, solution, optimal)

Let $S = \langle S, A, cost, T, s_1, S_G \rangle$ be a state space.

- ightharpoonup state s is reachable if a path from s_l to s exists
- ▶ paths from $s \in S$ to some state $s_G \in S_G$ are solutions for/from s
- \triangleright solutions for s_1 are called solutions for \mathcal{S}
- optimal solutions (for s) have minimal costs among all solutions (for s)

German: erreichbar, Lösung für/von s, optimale Lösung

Solving Search Problems

Consider again the running example.

informal description:

- ▶ find a sequence of
 - ▶ increment-mod10 (inc) and
 - ► square-mod10 (sqr) actions
- on the natural numbers from 0 to 9
- ▶ that reaches the number 6 or 7
- ▶ starting from the number 1
- > assuming each action costs 1.

How do you solve this?
...and then square...?

...or alternatively...?

State-Space Search

State-Space Search

State-space search is the algorithmic problem of finding solutions in state spaces or proving that no solution exists.

In optimal state-space search, only optimal solutions may be returned.

German: Zustandsraumsuche, optimale Zustandsraumsuche

State-Space Search

Learning Objectives for State-Space Search

Learning Objectives for the Topic of State-Space Search

- understanding state-space search:
 What is the problem and how can we formalize it?
- evaluate search algorithms: completeness, optimality, time/space complexity
- get to know search algorithms: uninformed vs. informed; tree and graph search
- evaluate heuristics for search algorithms: goal-awareness, safety, admissibility, consistency
- efficient implementation of search algorithms
- experimental evaluation of search algorithms
- design and comparison of heuristics for search algorithms

Foundations of Artificial Intelligence

B2. State-Space Search: Representation of State Spaces

Declarative Representations

B2.3 Declarative Representations

B2. State-Space Search: Representation of State Spaces

State Spaces as Explicit Graphs: Discussion

discussion:

- impossible for large state spaces (too much space required)
- ▶ if spaces small enough for explicit representations. solutions easy to compute: Dijkstra's algorithm $O(|S|\log|S|+|T|)$
- ▶ interesting for time-critical all-pairs-shortest-path queries (examples: route planning, path planning in video games)

M. Helmert (University of Basel)

February 26, 2025

B2. State-Space Search: Representation of State Spaces

Declarative Representations

State Spaces with Declarative Representations

State Spaces with Declarative Representations represent state spaces declaratively:

- **compact** description of state space as input to algorithms
- algorithms directly operate on compact description
- → allows automatic reasoning about problem: reformulation, simplification, abstraction, etc.

Example (declarative representation for 8-puzzle) puzzle8-domain.pddl + puzzle8-problem.pddl

Foundations of Artificial Intelligence

February 26, 2025

13 / 17

B2. State-Space Search: Representation of State Spaces

State Spaces as Black Boxes

State Spaces as Black Boxes

Define an abstract interface for state spaces.

For state space $S = \langle S, A, cost, T, s_I, S_G \rangle$ we need these methods:

- init(): generate initial state result: state s₁
- ▶ is_goal(s): test if s is a goal state result: **true** if $s \in S_G$; **false** otherwise
- ▶ succ(s): generate applicable actions and successors of s result: sequence of pairs $\langle a, s' \rangle$ with $s \xrightarrow{a} s'$
- ► cost(a): gives cost of action a result: cost(a) ($\in \mathbb{N}_0$)

Remark: we will extend the interface later in a small but important way

Foundations of Artificial Intelligence

February 26, 2025

Summary

- \triangleright state spaces often huge (> 10^{10} states) → how to represent?
- explicit graphs: adjacency lists or matrices; only suitable for small problems
- declaratively: compact description as input to search algorithms
- black box: implement an abstract interface

Blocks World

B3.2 Blocks World

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 26, 2025

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Blocks World

Blocks World

Blocks world is a traditional example problem in Al.

Setting: Blocks World

- Colored blocks lie on a table.
- ▶ They can be stacked into towers, moving one block at a time.
- ▶ Our task is to create a given goal configuration.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

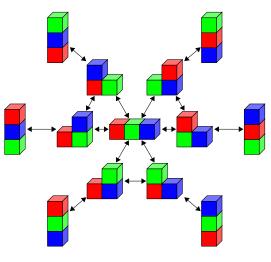

February 26, 2025

B3. State-Space Search: Examples of State Spaces

February 26, 2025

Example: Blocks World with Three Blocks

Action names omitted for readability. All actions cost 1. Initial state and goal can be arbitrary.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

February 26, 2025

B3. State-Space Search: Examples of State Spaces

Blocks World

Blocks World: Formal Definition

state space $\langle S, A, cost, T, s_1, S_G \rangle$ for blocks world with *n* blocks

State Space Blocks World

states *S*:

partitions of $\{1, 2, ..., n\}$ into nonempty ordered lists

example n = 3:

- \blacktriangleright { $\langle 1, 2, 3 \rangle$ }, { $\langle 1, 3, 2 \rangle$ }, { $\langle 2, 1, 3 \rangle$ }, $\{\langle 2, 3, 1 \rangle\}, \{\langle 3, 1, 2 \rangle\}, \{\langle 3, 2, 1 \rangle\}$
- $\blacktriangleright \{\langle 1,2\rangle,\langle 3\rangle\}, \{\langle 2,1\rangle,\langle 3\rangle\}, \{\langle 1,3\rangle,\langle 2\rangle\}$ $\{\langle 3,1\rangle,\langle 2\rangle\},\{\langle 2,3\rangle,\langle 1\rangle\},\{\langle 3,2\rangle,\langle 1\rangle\}$
- \blacktriangleright { $\langle 1 \rangle$, $\langle 2 \rangle$, $\langle 3 \rangle$ }

B3. State-Space Search: Examples of State Spaces

Blocks World

Blocks World: Formal Definition

state space $(S, A, cost, T, s_1, S_G)$ for blocks world with *n* blocks

State Space Blocks World

actions A:

- \blacktriangleright { $move_{u,v} \mid u,v \in \{1,\ldots,n\}$ with $u \neq v$ }
 - move block *u* onto block *v*.
 - ▶ both must be uppermost blocks in their towers
- \blacktriangleright {to-table_u | $u \in \{1, ..., n\}$ }
 - ightharpoonup move block u onto the table (\rightsquigarrow forming a new tower)
 - ► must be uppermost block in its tower

action costs cost:

cost(a) = 1 for all actions $a \in A$

M. Helmert (University of Basel)

B4. State-Space Search: Data Structures for Search Algorithms

Fundamental Data Structures for Search

We consider three abstract data structures for search:

- search node: stores a state that has been reached. how it was reached, and at which cost
 - → nodes of the example search tree
- open list: efficiently organizes leaves of search tree
 - → set of leaves of example search tree
- closed list: remembers expanded states to avoid duplicated expansions of the same state
 - inner nodes of a search tree

German: Suchknoten, Open-Liste, Closed-Liste

Not all algorithms use all three data structures, and they are sometimes implicit (e.g., on the CPU stack)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

B4. State-Space Search: Data Structures for Search Algorithms

B4.2 Search Nodes

B4. State-Space Search: Data Structures for Search Algorithms

Search Nodes

Search Nodes

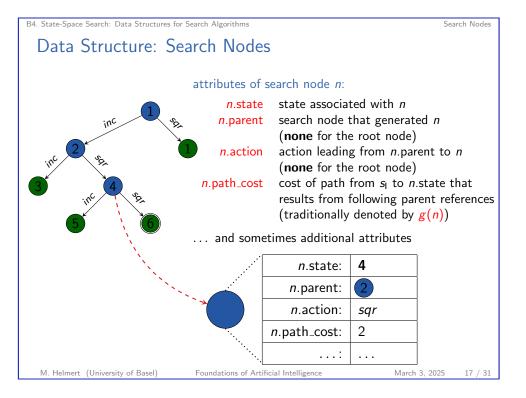

Search Node

M. Helmert (University of Basel)

A search node (node for short) stores a state that has been reached, how it was reached, and at which cost.

Collectively they form the so-called search tree (Suchbaum).

M. Helmert (University of Basel) Foundations of Artificial Intelligence March 3, 2025 Foundations of Artificial Intelligence

Search Nodes

March 3, 2025

Implementing Search Nodes

reasonable implementation of search nodes is easy

Foundations of Artificial Intelligence

advanced aspects:

M. Helmert (University of Basel)

- Do we need explicit nodes at all?
- ► Can we use lazy evaluation?
- ► Should we manually manage memory?
- ► Can we compress information?

```
Search Nodes: Java

Search Nodes: Java

Search Nodes (Java Syntax)
public interface State {
}

public interface Action {
}

public class SearchNode {
State state;
SearchNode parent;
Action action;
int pathCost;
}

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

18 / 31
```

B4. State-Space Search: Data Structures for Search Algorithms

Search Nodes

Operations on Search Nodes: make_root_node

Generate root node of a search tree:

```
function make_root_node()
node := new SearchNode
node.state := init()
node.parent := none
node.action := none
node.path_cost := 0
return node
```

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

Operations on Search Nodes: make_node

Generate child node of a search node:

function make_node(parent, action, state)

node := **new** SearchNode *node*.state := *state node*.parent := *parent node*.action := action

 $node.path_cost := parent.path_cost + cost(action)$

return node

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

Foundations of Artificial Intelligence

March 3, 2025

B4. State-Space Search: Data Structures for Search Algorithms

B4.3 Open Lists

Extract the path to a search node:

Operations on Search Nodes: extract_path

```
function extract_path(node)
path := \langle \rangle
while node.parent \neq none:
     path.append(node.action)
    node := node.parent
path.reverse()
return path
```

B4. State-Space Search: Data Structures for Search Algorithms

B4. State-Space Search: Data Structures for Search Algorithms

M. Helmert (University of Basel)

Open Lists

Open List

M. Helmert (University of Basel)

The open list (also: frontier) organizes the leaves of a search tree.

It must support two operations efficiently:

- determine and remove the next node to expand
- insert a new node that is a candidate node for expansion

Remark: despite the name, it is usually a very bad idea to implement open lists as simple lists.

M. Helmert (University of Basel) Foundations of Artificial Intelligence March 3, 2025 Foundations of Artificial Intelligence

Open Lists

Open Lists: Modify Entries

- ► Some implementations support modifying an open list entry when a shorter path to the corresponding state is found.
- ► This complicates the implementation.
- → We do not consider such modifications
 and instead use delayed duplicate elimination (→ later).

M. Helmert (University of Basel)

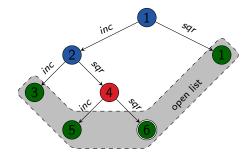

Foundations of Artificial Intelligence

March 3, 2025

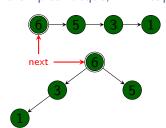

25 / 31

B4. State-Space Search: Data Structures for Search Algorithms

Interface of Open Lists

examples: deque, min-heap

• open list *open* organizes leaves of search tree with the methods:

open.is_empty() test if the open list is empty
 open.pop() remove and return the next node to expand
 open.insert(n) insert node n into the open list

- open determines strategy which node to expand next (depends on algorithm)
- underlying data structure choice depends on this strategy

M. Helmert (University of Basel)

B4. State-Space Search: Data Structures for Search Algorithms

Foundations of Artificial Intelligence

March 3, 2025 26 / 31

B4. State-Space Search: Data Structures for Search Algorithms

Closed Lists

Closed Lists

Closed Lists

Closed List

The closed list remembers expanded states to avoid duplicated expansions of the same state.

It must support two operations efficiently:

- insert a node whose state is not yet in the closed list
- test if a node with a given state is in the closed list; if yes, return it

Remark: despite the name, it is usually a very bad idea to implement closed lists as simple lists. (Why?)

B4 4 Closed Lists

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Search Algorithms

General Search Algorithm

iteratively create a search tree:

- starting with the initial state,
- repeatedly expand a state by generating its successors (which state depends on the used search algorithm)
- ▶ stop when a goal state is expanded (sometimes: generated)
- or all reachable states have been considered

In this chapter, we study two essential classes of search algorithms:

- tree search
- graph search

Each class consists of a large number of concrete algorithms.

German: expandieren, erzeugen, Baumsuche, Graphensuche

M. Helmert (University of Basel)

B5.2 Tree Search

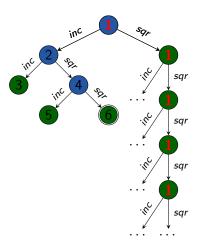

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

B5. State-Space Search: Tree Search and Graph Search

Tree Search: General Idea

- possible paths to be explored organized in a tree (search tree)
- search nodes correspond 1:1 to paths from initial state
- duplicates a.k.a. transpositions (i.e., multiple nodes with identical state) possible
- search tree can have unbounded depth

German: Suchbaum, Duplikate, Transpositionen

B5. State-Space Search: Tree Search and Graph Search

Generic Tree Search Algorithm

```
Generic Tree Search Algorithm
```

```
open := new OpenList
open.insert(make_root_node())
while not open.is_empty():
     n := open.pop()
     if is_goal(n.state):
           return extract_path(n)
     for each \langle a, s' \rangle \in \text{succ}(n.\text{state}):
          n' := \mathsf{make\_node}(n, a, s')
          open.insert(n')
return unsolvable
```

M. Helmert (University of Basel)

March 3, 2025

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Generic Tree Search Algorithm: Discussion

discussion:

- generic template for tree search algorithms
- → for concrete algorithm, we must (at least) decide how to implement the open list
- concrete algorithms often conceptually follow template, (= generate the same search tree), but deviate from details for efficiency reasons

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

B5. State-Space Search: Tree Search and Graph Search

B5.3 Graph Search

M. Helmert (University of Basel)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

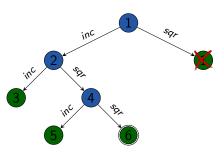

March 3, 2025

B5. State-Space Search: Tree Search and Graph Search

Graph Search

differences to tree search:

- recognize duplicates: when a state is reached on multiple paths, only keep one search node
- search nodes correspond 1:1 to reachable states
- depth of search tree bounded

remarks:

- some graph search algorithms do not immediately eliminate all duplicates (→ later)
- one possible reason: find optimal solutions when a path to state sfound later is cheaper than one found earlier

B5. State-Space Search: Tree Search and Graph Search

Graph Search

Generic Graph Search Algorithm

```
Generic Graph Search Algorithm
open := new OpenList
open.insert(make_root_node())
closed := new ClosedList
while not open.is_empty():
     n := open.pop()
    if closed.lookup(n.state) = none:
          closed.insert(n)
          if is_goal(n.state):
               return extract_path(n)
          for each \langle a, s' \rangle \in \text{succ}(n.\text{state}):
               n' := \mathsf{make\_node}(n, a, s')
               open.insert(n')
return unsolvable
```

M. Helmert (University of Basel) Foundations of Artificial Intelligence March 3, 2025

Foundations of Artificial Intelligence

Generic Graph Search Algorithm: Discussion

discussion:

- > same comments as for generic tree search apply
- in "pure" algorithm, closed list does not actually need to store the search nodes
 - sufficient to implement closed as set of states
 - advanced algorithms often need access to the nodes, hence we show this more general version here
- some variants perform goal and duplicate tests elsewhere (earlier) → following chapters

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Evaluating Search Algorithms

B5.4 Evaluating Search Algorithms

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 3, 2025

B5. State-Space Search: Tree Search and Graph Search

Evaluating Search Algorithms

Criteria: Completeness

four criteria for evaluating search algorithms:

Completeness

Is the algorithm guaranteed to find a solution if one exists?

Does it terminate if no solution exists?

first property: semi-complete both properties: complete

German: Vollständigkeit, semi-vollständig, vollständig

B5. State-Space Search: Tree Search and Graph Search

Evaluating Search Algorithms

Criteria: Optimality

four criteria for evaluating search algorithms:

Optimality

Are the solutions returned by the algorithm always optimal?

German: Optimalität

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Evaluating Search Algorithms

Criteria: Time Complexity

four criteria for evaluating search algorithms:

Time Complexity

How much time does the algorithm need until termination?

- usually worst case analysis
- usually measured in generated nodes

often a function of the following quantities:

- **b**: (branching factor) of state space (max. number of successors of a state)
- ▶ d: search depth (length of longest path in generated search tree)

German: Zeitaufwand, Verzweigungsgrad, Suchtiefe

B5. State-Space Search: Tree Search and Graph Search

Evaluating Search Algorithms

Criteria: Space Complexity

four criteria for evaluating search algorithms:

Space Complexity

How much memory does the algorithm use?

- usually worst case analysis
- usually measured in (concurrently) stored nodes

often a function of the following quantities:

- **b**: (branching factor) of state space (max. number of successors of a state)
- ▶ d: search depth (length of longest path in generated search tree)

German: Speicheraufwand

B6.1 Blind Search

March 5, 2025 M. Helmert (University of Basel) Foundations of Artificial Intelligence M. Helmert (University of Basel) Foundations of Artificial Intelligence

Blind Search

In Chapters B6–B8 we consider blind search algorithms:

Blind Search Algorithms

Blind search algorithms use no information about state spaces apart from the black box interface.

They are also called uninformed search algorithms.

contrast: heuristic search algorithms (Chapters B9-B15)

M. Helmert (University of Basel)

Breadth-first Search: Tree Search or Graph Search?

Breadth-first search can be performed

- without duplicate elimination (as a tree search) → BFS-Tree
- or with duplicate elimination (as a graph search) → BFS-Graph

```
(BFS = breadth-first search).
```

→ We consider both variants.

Properties of Breadth-first Search

B6.5 Properties of Breadth-first Search

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 5, 2025

41 / 4

Properties of Breadth-first Search:

- ▶ BFS-Tree is semi-complete, but not complete. (Why?)
- ► BFS-Graph is complete. (Why?)
- ▶ BFS (both variants) is optimal if all actions have the same cost (Why?), but not in general (Why not?).
- complexity: next slides

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 5, 2025

B6. State-Space Search: Breadth-first Search

Properties of Breadth-first Search

Breadth-first Search: Complexity

The following result applies to both BFS variants:

Theorem (time complexity of breadth-first search)

Let b be the branching factor and d be the minimal solution length of the given state space. Let $b \ge 2$.

Then the time complexity of breadth-first search is

$$1 + b + b^2 + b^3 + \cdots + b^d = O(b^d)$$

Reminder: we measure time complexity in generated nodes.

It follows that the space complexity of both BFS variants also is $O(b^d)$ (if $b \ge 2$). (Why?)

B6. State-Space Search: Breadth-first Search

Properties of Breadth-first Search

Breadth-first Search: Example of Complexity

example: b = 13; 100 000 nodes/second; 32 bytes/node

Rubik's cube:

M. Helmert (University of Basel)

▶ branching factor: ≈ 13

typical solution length: 18

d	nodes	time	memory
4	30 940	0.3 s	966 KiB
6	$5.2\cdot 10^6$	52 s	159 MiB
8	$8.8 \cdot 10^{8}$	147 min	26 GiB
10	10 ¹¹	17 days	4.3 TiB
12	10 ¹³	8 years	734 TiB
14	10 ¹⁵	1 352 years	121 PiB
16	10 ¹⁷	$2.2 \cdot 10^5$ years	20 EiB
18	10 ²⁰	$38\cdot 10^6$ years	3.3 ZiB

Properties of Breadth-first Search

BFS-Tree or BFS-Graph?

Which is better, BFS-Tree or BFS-Graph?

advantages of BFS-Graph:

- complete
- ▶ much (!) more efficient if there are many duplicates

advantages of BFS-Tree:

- simpler
- less overhead (time/space) if there are few duplicates

Conclusion

BFS-Graph is usually preferable, unless we know that there is a negligible number of duplicates in the given state space.

B6. State-Space Search: Breadth-first Search

M. Helmert (University of Basel)

Summar

Summary

- ▶ blind search algorithm: use no information except black box interface of state space
- breadth-first search: expand nodes in order of generation
 - search state space layer by layer
 - can be tree search or graph search
 - complexity $O(b^d)$ with branching factor b, minimal solution length d (if $b \ge 2$)
 - complete as a graph search; semi-complete as a tree search
 - optimal with uniform action costs

Foundations of Artificial Intelligence

March 5, 2025

B7. State-Space Search: Uniform Cost Search

Uniform Cost Search

- breadth-first search optimal if all action costs equal
- ▶ otherwise no optimality guarantee → example:

- consider bounded inc-and-square problem with cost(inc) = 1, cost(sqr) = 3
- solution of breadth-first search still $\langle inc, sqr, sqr \rangle$ (cost: 7)
- **but**: (inc, inc, inc, inc, inc) (cost: 5) is cheaper!

remedy: uniform cost search

- ► always expand a node with minimal path cost $(n.path_cost a.k.a. g(n))$
- implementation: priority queue (min-heap) for open list

Reminder: Generic Graph Search Algorithm

reminder from Chapter B5:

```
Generic Graph Search
open := new OpenList
open.insert(make_root_node())
closed := new ClosedList
while not open.is_empty():
     n := open.pop()
     if closed.lookup(n.state) = none:
           closed.insert(n)
           if is_goal(n.state):
                return extract_path(n)
          for each \langle a, s' \rangle \in \text{succ}(n.\text{state}):
                n' := \mathsf{make\_node}(n, a, s')
                open.insert(n')
return unsolvable
```

Foundations of Artificial Intelligence

Uniform Cost Search Uniform Cost Search open := **new** MinHeap ordered by g open.insert(make_root_node()) closed := new HashSet while not open.is_empty(): $n := open.pop_min()$ **if** n.state \notin closed: closed.insert(n.state) **if** is_goal(*n*.state): return extract_path(n) for each $\langle a, s' \rangle \in \text{succ}(n.\text{state})$: $n' := \mathsf{make_node}(n, a, s')$ open.insert(n') return unsolvable

Foundations of Artificial Intelligence

March 5, 2025

B7. State-Space Search: Uniform Cost Search

Uniform Cost Search: Discussion

Adapting generic graph search to uniform cost search:

- ▶ here, early goal tests/early updates of the closed list not a good idea. (Why not?)
- ▶ as in BFS-Graph, a set is sufficient for the closed list
- ▶ a tree search variant is possible, but rare: has the same disadvantages as BFS-Tree and in general not even semi-complete (Why not?)

Remarks:

- ▶ identical to Dijkstra's algorithm for shortest paths
- ▶ for both: variants with/without delayed duplicate elimination

M. Helmert (University of Basel)

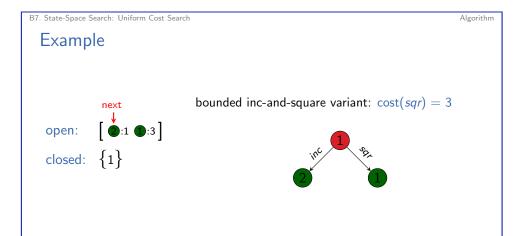

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

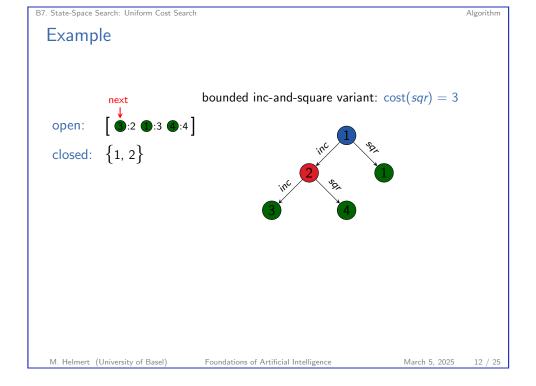

March 5, 2025

Completeness and Optimality

B7. State-Space Search: Uniform Cost Search

properties of uniform cost search:

- uniform cost search is complete (Why?)
- uniform cost search is optimal (Why?)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 5, 2025

B7. State-Space Search: Uniform Cost Search

Time and Space Complexity

properties of uniform cost search:

- ► Time complexity depends on distribution of action costs (no simple and accurate bounds).
 - Let $\varepsilon := \min_{a \in A} cost(a)$ and consider the case $\varepsilon > 0$.
 - ightharpoonup Let c^* be the optimal solution cost.
 - Let b be the branching factor and consider the case $b \ge 2$.
 - ▶ Then the time complexity is at most $O(b^{\lfloor c^*/\varepsilon \rfloor + 1})$. (Why?)
 - often a very weak upper bound
- space complexity = time complexity

Depth-first Search

Depth-first Search: Some Properties

- ▶ almost always implemented as a tree search (we will see why)
- ▶ not complete, not semi-complete, not optimal (Why?)
- complete for acyclic state spaces, e.g., if state space directed tree

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Reminder: Generic Tree Search Algorithm

reminder from Chapter B5:

```
Generic Tree Search

open := new 	ext{ OpenList}

open.insert(make\_root\_node())

while not open.is\_empty():

n := open.pop()

if is\_goal(n.state):

return extract_path(n)

for each \langle a, s' \rangle \in succ(n.state):

n' := make\_node(n, a, s')

open.insert(n')

return unsolvable
```

B8. State-Space Search: Depth-first Search & Iterative Deepening

Depth-first Search

Depth-first Search (Non-recursive Version)

depth-first search (non-recursive version):

```
Depth-first Search (Non-recursive Version)

open := new Stack

open.push\_back(make\_root\_node())

while not open.is\_empty():

n := open.pop\_back()

if is\_goal(n.state):

return \ extract\_path(n)

for each \langle a, s' \rangle \in succ(n.state):

n' := make\_node(n, a, s')

open.push\_back(n')

return unsolvable
```

M. Helmert (University of Basel)

Depth-first Search

Non-recursive Depth-first Search: Discussion

discussion:

- ► there isn't much wrong with this pseudo-code (as long as we ensure to release nodes that are no longer required when using programming languages without garbage collection)
- however, depth-first search as a recursive algorithm is simpler and more efficient
- → no search node data structure needed

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

17 / 35

arch B8. State-Space Search: Depth-first Search & Iterative Deepening

Depth-first Search (Recursive Version)

Depth-first Search

function depth_first_search(s)

if is_goal(s):
 return $\langle \rangle$ for each $\langle a, s' \rangle \in \text{succ}(s)$:
 solution := depth_first_search(s')
 if solution \neq none:
 solution.push_front(a)

main function:

return none

Depth-first Search (Recursive Version)

return depth_first_search(init())

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

B8. State-Space Search: Depth-first Search & Iterative Deepening

Denth-first Search

Depth-first Search: Complexity

time complexity:

- If the state space includes paths of length m, depth-first search can generate O(b^m) nodes, even if much shorter solutions (e.g., of length 1) exist.
- On the other hand: in the best case, solutions of length ℓ can be found with $O(b\ell)$ generated nodes. (Why?)
- ightharpoonup improvable to $O(\ell)$ with incremental successor generation

space complexity:

- only need to store nodes along currently explored path ("along": nodes on path and their children)
- \rightarrow space complexity O(bm) if m maximal search depth reached
- low memory complexity main reason why depth-first search interesting despite its disadvantages

B8. State-Space Search: Depth-first Search & Iterative Deepening

return solution

Iterative Deepening

B8.2 Iterative Deepening

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

Idea of Depth-limited Search

depth-limited search:

- \triangleright parameterized with depth limit $\ell \in \mathbb{N}_0$
- behaves like depth-first search, but prunes (does not expand) search nodes at depth ℓ
- ▶ not very useful on its own, but important ingredient of more useful algorithms

German: tiefenbeschränkte Suche

M. Helmert (University of Basel)

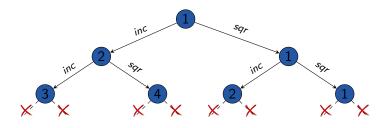

Foundations of Artificial Intelligence

March 17, 2025

B8. State-Space Search: Depth-first Search & Iterative Deepening

Depth-limited Search Example

Consider depth limit $\ell = 2$.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

B8. State-Space Search: Depth-first Search & Iterative Deepening

Iterative Deepening

Depth-limited Search: Pseudo-Code

```
function depth_limited_search(s, depth_limit):
if is_goal(s):
     return ()
if depth\_limit > 0:
     for each \langle a, s' \rangle \in \text{succ}(s):
           solution := depth\_limited\_search(s', depth\_limit - 1)
           if solution \neq none:
                solution.push_front(a)
                return solution
return none
```

B8. State-Space Search: Depth-first Search & Iterative Deepening

Iterative Deepening Depth-first Search

iterative deepening depth-first search (iterative deepening DFS):

- ▶ idea: perform a sequence of depth-limited searches with increasing depth limit
- > sounds wasteful (each iteration repeats all the useful work of all previous iterations)
- ▶ in fact overhead acceptable (→ analysis follows)

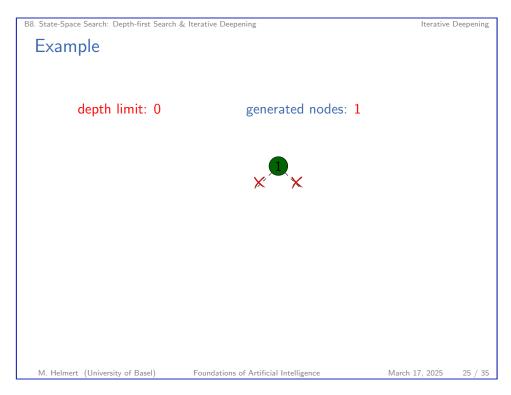

Iterative Deepening DFS

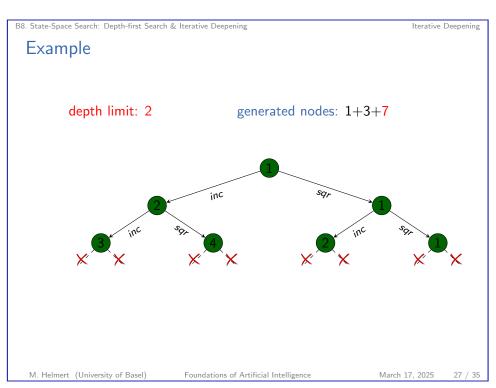

```
for depth\_limit \in \{0, 1, 2, ...\}:
     solution := depth\_limited\_search(init(), depth\_limit)
     if solution \neq none:
          return solution
```

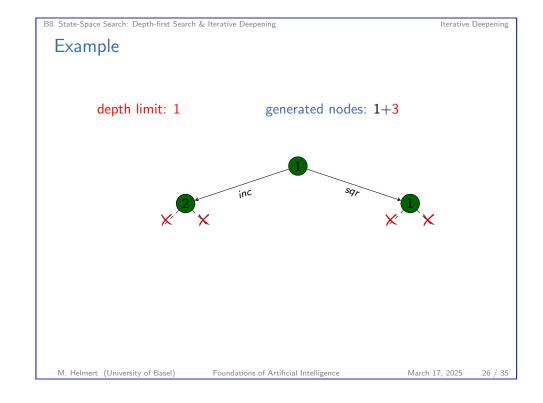

German: iterative Tiefensuche

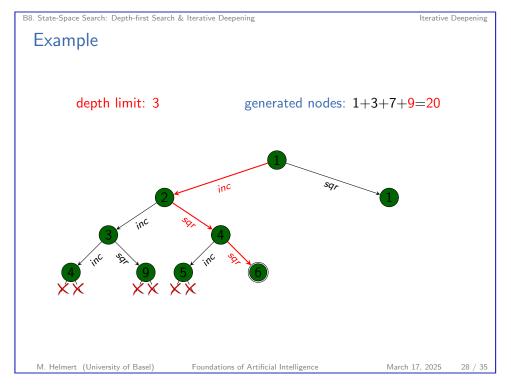

Foundations of Artificial Intelligence

March 17, 2025

Iterative Deepening

Iterative Deepening DFS: Properties

combines advantages of breadth-first and depth-first search:

- ► (almost) like BFS: semi-complete (however, not complete)
- ▶ like BFS: optimal if all actions have same cost
- ▶ like DFS: only need to store nodes along one path \rightsquigarrow space complexity O(bd), where d minimal solution length
- time complexity only slightly higher than BFS (→ analysis soon)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

29 / 35

B8. State-Space Search: Depth-first Search & Iterative Deepening

Iterative Deepening

Iterative Deepening DFS: Complexity Example

time complexity (generated nodes):

breadth-first search	$1+b+b^2+\cdots+b^{d-1}+b^d$
iterative deepening DFS	$(d+1)+db+(d-1)b^2+\cdots+2b^{d-1}+1b^d$

example: b = 10, d = 5

breadth-first search	1+10+100+1000+10000+100000		
	= 111111		
iterative deepening DFS	6+50+400+3000+20000+100000		
	= 123456		

for b = 10, only 11% more nodes than breadth-first search

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

B8. State-Space Search: Depth-first Search & Iterative Deepening

Iterative Deepening

Iterative Deepening DFS: Time Complexity

Theorem (time complextive of iterative deepening DFS)

Let b be the branching factor and d be the minimal solution length of the given state space. Let $b \ge 2$.

Then the time complexity of iterative deepening DFS is

$$(d+1)+db+(d-1)b^2+(d-2)b^3+\cdots+1b^d=O(b^d)$$

and the memory complexity is

O(bd).

B8. State-Space Search: Depth-first Search & Iterative Deepening

Iterative Deeneni

Iterative Deepening DFS: Evaluation

Iterative Deepening DFS: Evaluation

Iterative Deepening DFS is often the method of choice if

- tree search is adequate (no duplicate elimination necessary),
- ▶ all action costs are identical, and
- ▶ the solution depth is unknown.

B8.3 Summary

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 17, 2025

B8. State-Space Search: Depth-first Search & Iterative Deepening

Summa

Comparison of Blind Search Algorithms

completeness, optimality, time and space complexity

	1 1 2.1				
	search algorithm				
criterion	breadth-	uniform	depth-	depth-	iterative
	first	cost	first	limited	deepening
complete?	yes*	yes	no	no	semi
optimal?	yes**	yes	no	no	yes**
time	$O(b^d)$	$O(b^{\lfloor c^*/\varepsilon \rfloor + 1})$	$O(b^m)$	$O(b^\ell)$	$O(b^d)$
space	$O(b^d)$	$O(b^{\lfloor c^*/\varepsilon \rfloor + 1})$	O(bm)	$O(b\ell)$	O(bd)

- $b \ge 2$ branching factor
 - d minimal solution depth
 - m maximal search depth
 - ℓ depth limit
 - c^* optimal solution cost
- > 0 minimal action cost

remarks:

- * for BFS-Tree: semi-complete
- ** only with uniform action costs

M. Helmert (University of Basel) Foundations of Artificial Intelligence

B8. State-Space Search: Depth-first Search & Iterative Deepening

Summary

depth-first search: expand nodes in LIFO order

- usually as a tree search
- easy to implement recursively
- very memory-efficient
- can be combined with iterative deepening to combine many of the good aspects of breadth-first and depth-first search

B9. State-Space Search: Heuristics

Informed Search Algorithms

search algorithms considered so far:

example: b = 13; 10^5 nodes/second

- uninformed ("blind"): use no information besides formal definition to solve a problem
- scale poorly: prohibitive time (and space) requirements for seemingly simple problems (time complexity usually $O(b^d)$)

nodes	time
30 940	0.3 s
$5.2\cdot 10^6$	52 s
$8.8 \cdot 10^{8}$	147 min
10 ¹¹	17 days
10 ¹³	8 years
10 ¹⁵	1 352 years
10 ¹⁷	$2.2 \cdot 10^5$ years
10 ²⁰	$38 \cdot 10^6$ years
	30940 $5.2 \cdot 10^{6}$ $8.8 \cdot 10^{8}$ 10^{11} 10^{13} 10^{15}

B9. State-Space Search: Heuristics

Heuristics

Heuristics: Intuition

idea: h(s) estimates distance (= cost of cheapest path) from s to closest goal state

- heuristics can be arbitrary functions
- intuition:
 - the closer *h* is to true goal distance, the more efficient the search using *h*
 - ② the better *h* separates states that are close to the goal from states that are far, the more efficient the search using *h*

B11. State-Space Search: Best-first Graph Search

Best-first Search

Best-first Search

Best-first search is a class of search algorithms that expand the "most promising" node in each iteration.

- decision which node is most promising uses heuristics...
- but not necessarily exclusively.

B11. State-Space Search: Best-first Graph Search

Best-first Search

Best-first Search

Best-first search is a class of search algorithms that expand the "most promising" node in each iteration.

- decision which node is most promising uses heuristics...
- but not necessarily exclusively.

Best-first Search

A best-first search is a heuristic search algorithm that evaluates search nodes with an evaluation function f and always expands a node n with minimal f(n) value.

German: Bestensuche, Bewertungsfunktion

- implementation essentially like uniform cost search
- \blacktriangleright different choices of $f \rightsquigarrow$ different search algorithms

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 19, 2025

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

B11. State-Space Search: Best-first Graph Search

The Most Important Best-first Search Algorithms

the most important best-first search algorithms:

- ightharpoonup f(n) = h(n.state): greedy best-first search → only the heuristic counts
- f(n) = g(n) + h(n.state): A* → combination of path cost and heuristic
- $f(n) = g(n) + w \cdot h(n.state)$: weighted A* $w \in \mathbb{R}_0^+$ is a parameter

→ interpolates between greedy best-first search and A*

German: gierige Bestensuche, A*, Weighted A* → properties: next chapters

What do we obtain with f(n) := g(n)?

Best-first Search without Reopening (Final Version)

```
Best-first Search without Reopening
open := new MinHeap ordered by \langle f, h \rangle
if h(\text{init}()) < \infty:
      open.insert(make_root_node())
closed := new HashSet
while not open.is_empty():
     n := open.pop_min()
     if n.state ∉ closed:
           closed.insert(n.state)
           if is_goal(n.state):
                 return extract_path(n)
           for each \langle a, s' \rangle \in \text{succ}(n.\text{state}):
                if h(s') < \infty:
                      n' := \mathsf{make\_node}(n, a, s')
                      open.insert(n')
return unsolvable
```

Best-first Search w/o Reopening (1st Attempt): Discussion

Discussion:

B11. State-Space Search: Best-first Graph Search

This is already an acceptable implementation of best-first search.

two useful improvements:

- ► discard states considered unsolvable by the heuristic
 → saves memory in open
- ▶ if multiple search nodes have identical f values, use h to break ties (preferring low h)
 - not always a good idea, but often
 - \triangleright obviously unnecessary if f = h (greedy best-first search)

B11. State-Space Search: Best-first Graph Search

Reopening

- reminder: uniform cost search expands nodes in order of increasing g values
- → guarantees that cheapest path to state of a node has been found when the node is expanded
- with arbitrary evaluation functions *f* in best-first search this does not hold in general
- → in order to find solutions of low cost. we may want to expand duplicate nodes when cheaper paths to their states are found (reopening)

German: Reopening

A*: Implementation Aspects

some practical remarks on implementing A*:

- common bug: reopening not implemented although heuristic is not consistent
- common bug: duplicate test "too early" (upon generation of search nodes)
- ► common bug: goal test "too early" (upon generation of search nodes)
- ▶ all these bugs lead to loss of optimality and can remain undetected for a long time

complete with safe heuristics

→ proofs: Chapters B14 and B15

(like all variants of best-first graph search)

without reopening: optimal with heuristics

that are admissible and consistent

with reopening: optimal with admissible heuristics

B12. State-Space Search: Greedy BFS, A*, Weighted A*

A*: Properties

B12.4 Weighted A*

M. Helmert (University of Basel) Foundations of Artificial Intelligence March 26, 2025 M. Helmert (University of Basel) Foundations of Artificial Intelligence March 26, 2025 28 / 32 B12. State-Space Search: Greedy BFS, A*, Weighted A*

Weighted A*

B12. State-Space Search: Greedy BFS, A*, Weighted A* Weighted A*: Properties

Weighted A*

A* with more heavily weighted heuristic:

 $f(n) = g(n) + w \cdot h(n.state),$

where weight $w \in \mathbb{R}^+_0$ with $w \geq 1$ is a freely choosable parameter

Note: w < 1 is conceivable, but usually not a good idea (Why not?)

M. Helmert (University of Basel)

March 26, 2025

29 / 32

 $\mathbf{w} = 0$: like uniform cost search

- w = 1: like A^*
- $\triangleright w \to \infty$: like greedy best-first search

weight parameter controls "greediness" of search:

with $w \ge 1$ properties analogous to A*:

h admissible:

found solution guaranteed to be at most w times as expensive as optimum when reopening is used

▶ h admissible and consistent: found solution guaranteed to be at most w times as expensive as optimum; no reopening needed

(without proof)

IDA*

The main drawback of the presented best-first graph search algorithms is their space complexity.

Idea: use the concepts of iterative-deepening DFS

- depth-limited search with increasing limits
- instead of depth we limit f(in this chapter f(n) := g(n) + h(n.state) as in A*)
- → IDA* (iterative-deepening A*)
- tree search, unlike the previous best-first search algorithms

) / 20

IDA*: Algorithm

Growing the *f* Limit

▶ In IDDFS, we grow the limit from the smallest limit that gives a non-empty search tree (0) by 1 at a time.

- ► This usually leads to exponential growth of the tree between rounds, so that re-exploration work can be amortized.
- ▶ In our first attempt at IDA*, there is no guarantee that increasing the *f* limit by 1 will lead to a larger search tree than in the previous round.
- ➤ This problem becomes worse if we also allow non-integer (fractional) costs, where increasing the limit by 1 would be very arbitrary.

B13. State-Space Search: IDA* IDA*: Algor

IDA* First Attempt: Discussion

- ➤ The pseudo-code can be rewritten to be even more similar to our IDDFS pseudo-code. However, this would make our next modification more complicated.
- ► The algorithm follows the same principles as IDDFS, but takes path costs and heuristic information into account.
- For unit-cost state spaces and the trivial heuristic $h: s \mapsto 0$ for all states s, it behaves identically to IDDFS.
- ► For general state spaces, there is a problem with this first attempt, however.

B13. State-Space Search: IDA*

IDA*: Algorithm

Setting the Next *f* Limit

idea: let the f-limited search compute the next sensible f limit

- Start with h(init()), the smallest f limit that results in a non-empty search tree.
- ▶ In every round, increase the *f* limit to the smallest value that ensures that in the next round at least one additional path will be considered by the search.
- → f_limited_search now returns two values:
 - ▶ the next f limit that would include at least one new node in the search tree (∞ if no such limit exists; none if a solution was found), and
 - the solution that was found (or **none**).

IDA*: Properties

Inherits important properties of A* and depth-first search:

- ightharpoonup semi-complete if h safe and cost(a) > 0 for all actions a
- optimal if h admissible
- **space complexity** $O(\ell b)$, where
 - \triangleright ℓ : length of longest generated path (for unit cost problems: bounded by optimal solution cost)
 - b: branching factor

We state these without proof.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 26, 2025

IDA*: Properties

B13. State-Space Search: IDA*

IDA*: Discussion

- compared to A* potentially considerable overhead because no duplicates are detected
 - → exponentially slower in many state spaces
 - → often combined with partial duplicate elimination (cycle detection, transposition tables)
- overhead due to iterative increases of f limit often negligible, but not always
 - especially problematic if action costs vary a lot: then it can easily happen that each new f limit only considers a small number of new paths

Solvable States

Definition (solvable)

A state s of a state space is called solvable if $h^*(s) < \infty$.

German: lösbar

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

5 8/2

Introduction

Optimal Paths to States

Definition (g^*)

Let s be a state of a state space with initial state s_1 .

We write $g^*(s)$ for the cost of an optimal (cheapest) path from s_l to s (∞ if s is unreachable).

Remarks:

- \triangleright g is defined for nodes, g^* for states (Why?)
- ▶ $g^*(n.state) \le g(n)$ for all nodes n generated by a search algorithm (Why?)

Foundations of Artificial Intelligence

March 31, 2025

.

B14. State-Space Search: Properties of A*, Part I

Optimal Continuation Lemma

Optimal Continuation Lemma

We now show the first important result for A* with reopening:

Lemma (optimal continuation lemma)

Consider A* with reopening using a safe heuristic at the beginning of any iteration of the while loop.

lf

- state s is settled.
- ► state s' is a solvable successor of s, and
- ▶ an optimal path from s_1 to s' of the form $\langle s_1, \ldots, s, s' \rangle$ exists,

then

- \triangleright s' is settled or
- ▶ open contains a node n' with n'.state = s' and $g(n') = g^*(s')$.

German: Optimale-Fortsetzungs-Lemma

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

12 / 26

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

Optimal Continuation Lemma: Intuition

(Proof follows on the next slides.)

Intuitively, the lemma states:

If no optimal path to a given state has been found yet, open must contain a "good" node that contributes to finding an optimal path to that state.

(This potentially requires multiple applications of the lemma along an optimal path to the state.)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

Optimal Continuation Lemma: Proof (1)

Proof.

B14. State-Space Search: Properties of A*, Part I

Consider states s and s' with the given properties at the start of some iteration ("iteration A") of A^* .

Because s is settled, an earlier iteration ("iteration B") set $distances[s] := g^*(s)$.

Thus iteration B removed a node nwith n.state = s and $g(n) = g^*(s)$ from open.

A* did not terminate in iteration B. (Otherwise iteration A would not exist.) Hence n was expanded in iteration B.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

B14. State-Space Search: Properties of A*, Part I

Optimal Continuation Lemma

Optimal Continuation Lemma: Proof (2)

Proof (continued).

This expansion considered the successor s' of s.

Because s' is solvable, we have $h^*(s') < \infty$.

Because *h* is safe, this implies $h(s') < \infty$.

Hence a successor node n' was generated for s'.

This node n' satisfies the consequence of the lemma. Hence the criteria of the lemma were satisfied for s and s' after iteration B.

To complete the proof, we show: if the consequence of the lemma is satisfied at the beginning of an iteration, it is also satisfied at the beginning of the next iteration.

B14. State-Space Search: Properties of A*, Part I

Optimal Continuation Lemma

Optimal Continuation Lemma: Proof (3)

Proof (continued).

- ightharpoonup If s' is settled at the beginning of an iteration, it remains settled until termination.
- ▶ If s' is not yet settled and open contains a node n'with n'.state = s' and $g(n') = g^*(s')$ at the beginning of an iteration, then either the node remains in open during the iteration, or n' is removed during the iteration and s' becomes settled.

f-Bound Lemma

f-Bound Lemma

B14. State-Space Search: Properties of A*, Part I

B14.3 f-Bound Lemma

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

We need a second lemma:

Lemma (f-bound lemma)

Consider A* with reopening and an admissible heuristic applied to a solvable state space with optimal solution cost c^* .

Then open contains a node n with $f(n) \le c^*$ at the beginning of each iteration of the while loop.

German: f-Schranken-Lemma

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

B14. State-Space Search: Properties of A*, Part I

f-Bound Lemma

f-Bound Lemma: Proof (1)

Proof.

Consider the situation at the beginning of any iteration of the while loop.

Let $\langle s_0, \ldots, s_n \rangle$ with $s_0 := s_1$ be an optimal solution. (Here we use that the state space is solvable.)

Let s_i be the first state in the sequence that is not settled.

(Not all states in the sequence can be settled: s_n is a goal state, and when a goal state is inserted into distances, A* terminates.)

B14. State-Space Search: Properties of A*, Part I

f-Bound Lemma

f-Bound Lemma: Proof (2)

Proof (continued).

Case 1: i = 0

Because $s_0 = s_1$ is not settled yet, we are at the first iteration of the **while** loop.

Because the state space is solvable and h is admissible, we have $h(s_0) < \infty$.

Hence *open* contains the root n_0 .

We obtain: $f(n_0) = g(n_0) + h(s_0) = 0 + h(s_0) \le h^*(s_0) = c^*$, where "<" uses the admissibility of h.

This concludes the proof for this case.

Foundations of Artificial Intelligence

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

M. Helmert (University of Basel)

f-Bound Lemma

f-Bound Lemma: Proof (3)

Proof (continued).

Case 2: i > 0

Then s_{i-1} is settled and s_i is not settled.

Moreover, s_i is a solvable successor of s_{i-1} and $\langle s_0, \ldots, s_{i-1}, s_i \rangle$ is an optimal path from s_0 to s_i .

We can hence apply the optimal continuation lemma (with $s = s_{i-1}$ and $s' = s_i$) and obtain:

- (A) s_i is settled, or
- (B) open contains n' with n'.state $= s_i$ and $g(n') = g^*(s_i)$.

Because (A) is false, (B) must be true.

We conclude: open contains n' with

$$f(n') = g(n') + h(s_i) = g^*(s_i) + h(s_i) \le g^*(s_i) + h^*(s_i) = c^*$$
, where "\le " uses the admissibility of h.

.

B14. State-Space Search: Properties of A*, Part I

Optimality of A* with Reopening

Optimality of A* with Reopening

We can now show the main result of this chapter:

Theorem (optimality of A* with reopening)

A* with reopening is optimal when using an admissible heuristic.

B14. State-Space Search: Properties of A*, Part I

Optimality of A* with Reopening

Optimality of A* with Reopening: Proof

Proof.

By contradiction: assume that the theorem is wrong.

Hence there is a state space with optimal solution cost c^* where A* with reopening and an admissible heuristic returns a solution with cost $c > c^*$.

This means that in the last iteration, the algorithm removes a node n with $g(n) = c > c^*$ from open.

With h(n.state) = 0 (because h is admissible and hence goal-aware), this implies:

$$f(n) = g(n) + h(n.state) = g(n) + 0 = g(n) = c > c^*.$$

A* always removes a node n with minimal f value from open. With $f(n) > c^*$, we get a contradiction to the f-bound lemma, which completes the proof.

B14. State-Space Search: Properties of A*, Part I

Summary

- ▶ A* with reopening using an admissible heuristic is optimal.
- ► The proof is based on the following lemmas that hold for solvable state spaces and admissible heuristics:
 - optimal continuation lemma: The open list always contains nodes that make progress towards an optimal solution.
 - ► f-bound lemma: The minimum f value in the open list at the beginning of each A* iteration is a lower bound on the optimal solution cost.

Monotonicity Lemma

March 31, 2025

A*: Monotonicity Lemma (1)

Lemma (monotonicity of A* with consistent heuristics)

Consider A* with a consistent heuristic.

Then:

- If n' is a child node of n, then f(n') > f(n).
- 2 On all paths generated by A*, f values are non-decreasing.
- 3 The sequence of f values of the nodes expanded by A* is non-decreasing.

German: Monotonielemma

Foundations of Artificial Intelligence

Monotonicity Lemma

A*: Monotonicity Lemma (2)

Proof.

on 1.:

Let n' be a child node of n via action a.

Let s = n.state, s' = n'.state.

- by definition of f: f(n) = g(n) + h(s), f(n') = g(n') + h(s')
- by definition of g: g(n') = g(n) + cost(a)
- ▶ by consistency of h: $h(s) \le cost(a) + h(s')$
- $f(n) = g(n) + h(s) \le g(n) + cost(a) + h(s')$ = g(n') + h(s') = f(n')

on 2.: follows directly from 1.

B15. State-Space Search: Properties of A*, Part II

Optimality of A* without Reopening

Optimality of A* without Reopening

Theorem (optimality of A* without reopening)

A* without reopening is optimal when using an admissible and consistent heuristic.

Proof.

From the monotonicity lemma, the sequence of f values of nodes removed from the open list is non-decreasing.

- \rightarrow If multiple nodes with the same state s are removed from the open list, then their g values are non-decreasing.
- → If we allowed reopening, it would never happen.
- → With consistent heuristics, A* without reopening behaves the same way as A* with reopening.

The result follows because A* with reopening and admissible heuristics is optimal.

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

Time Complexity of A*

B15.4 Time Complexity of A*

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

B15. State-Space Search: Properties of A*, Part II

Time Complexity of A* (1)

What is the time complexity of A*?

- depends strongly on the quality of the heuristic
- \blacktriangleright an extreme case: h = 0 for all states
 - → A* identical to uniform cost search
- ▶ another extreme case: $h = h^*$ and cost(a) > 0for all actions a
 - → A* only expands nodes along an optimal solution
 - \rightarrow $O(\ell^*)$ expanded nodes, $O(\ell^*b)$ generated nodes, where
 - \blacktriangleright ℓ^* : length of the found optimal solution
 - b: branching factor

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

March 31, 2025

B15. State-Space Search: Properties of A*, Part II

Time Complexity of A*

Time Complexity of A* (2)

more precise analysis:

dependency of the runtime of A* on heuristic error

example:

- unit cost problems with
- constant branching factor and
- ightharpoonup constant absolute error: $|h^*(s) h(s)| < c$ for all $s \in S$

time complexity:

- ▶ if state space is a tree: time complexity of A* grows linearly in solution length (Pohl 1969; Gaschnig 1977)
- ▶ general search spaces: runtime of A* grows exponentially in solution length (Helmert & Röger 2008)

B15. State-Space Search: Properties of A*, Part II

Time Complexity of A*

Overhead of Reopening

How does reopening affect runtime?

- ▶ For most practical state spaces and inconsistent admissible heuristics, the number of reopened nodes is negligible.
- exceptions exist: Martelli (1977) constructed state spaces with n states where exponentially many (in n) node reopenings occur in A^* . (→ exponentially worse than uniform cost search)

M. Helmert (University of Basel)

Foundations of Artificial Intelligence March 31, 2025

B15. State-Space Search: Properties of A*, Part II

Summary

- ► A* without reopening using an admissible and consistent heuristic is optimal
- key property monotonicity lemma (with consistent heuristics):
 - ► f values never decrease along paths considered by A*
 - sequence of f values of expanded nodes is non-decreasing
- time complexity depends on heuristic and shape of state space
 - precise details complex and depend on many aspects
 - reopening increases runtime exponentially in degenerate cases, but usually negligible overhead
 - small improvements in heuristic values often lead to exponential improvements in runtime

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Combinatorial Optimization Problems

Definition (combinatorial optimization problem)

A combinatorial optimization problem (COP)

is given by a tuple $\langle C, S, opt, v \rangle$ consisting of:

- ► a finite set of (solution) candidates C
- ▶ a finite set of solutions $S \subseteq C$
- ▶ an objective sense $opt \in \{min, max\}$
- ▶ an objective function $v: S \to \mathbb{R}$

German: kombinatorisches Optimierungsproblem, Kandidaten, Lösungen, Optimierungsrichtung, Zielfunktion

Remarks:

- "problem" here in another sense (= "instance") than commonly used in computer science
- practically interesting COPs usually have too many candidates to enumerate explicitly

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Optimal Solutions

Definition (optimal)

Let $\mathcal{O} = \langle C, S, opt, v \rangle$ be a COP.

The optimal solution quality v^* of \mathcal{O} is defined as

$$v^* = \begin{cases} \min_{c \in S} v(c) & \text{if } opt = \min \\ \max_{c \in S} v(c) & \text{if } opt = \max \end{cases}$$

(v^* is undefined if $S = \emptyset$.)

A solution s of \mathcal{O} is called optimal if $v(s) = v^*$.

German: optimale Lösungsqualität, optimal

Combinatorial Optimization

Combinatorial Optimization

The basic algorithmic problem we want to solve:

Combinatorial Optimization

Find a solution of good (ideally, optimal) quality for a combinatorial optimization problem $\mathcal O$ or prove that no solution exists.

Good here means close to v^* (the closer, the better).

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 2, 2025

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Relevance and Hardness

- ► There is a huge number of practically important combinatorial optimization problems.
- ▶ Solving these is a central focus of operations research.
- ► Many important combinatorial optimization problems are NP-complete.
- ▶ Most "classical" NP-complete problems can be formulated as combinatorial optimization problems.
- → Examples: TSP, VERTEXCOVER, CLIQUE, BINPACKING, PARTITION

German: Unternehmensforschung, NP-vollständig

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Search vs. Optimization

Combinatorial optimization problems have

- ► a search aspect (among all candidates C, find a solution from the set S) and
- \triangleright an optimization aspect (among all solutions in S, find one of high quality).

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Combinatorial Optimization

Pure Search/Optimization Problems

Important special cases arise when one of the two aspects is trivial:

- pure search problems:
 - ► all solutions are of equal quality
 - ▶ difficulty is in finding a solution at all
 - \triangleright formally: v is a constant function (e.g., constant 0); opt can be chosen arbitrarily (does not matter)
- pure optimization problems:
 - all candidates are solutions
 - difficulty is in finding solutions of high quality
 - ightharpoonup formally: S = C

Search Methods for Combinatorial Optimization

C1.3 Local Search: Hill Climbing

- ▶ main ideas of heuristic search applicable for COPs
 → states ≈ candidates
- main difference: no "actions" in problem definition
 - ▶ instead, we (as algorithm designers) can choose which candidates to consider neighbors
 - definition of neighborhood critical aspect of designing good algorithms for a given COP
- "path to goal" irrelevant to the user
 - no path costs, parents or generating actions
 - → no search nodes needed

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Local Search: Hill Climbing

Local Search: Idea

M. Helmert (University of Basel)

main ideas of local search algorithms for COPs:

- ▶ heuristic *h* estimates quality of candidates
 - ightharpoonup for pure optimization: often objective function v itself
 - ► for pure search: often distance estimate to closest solution (as in state-space search)
- ▶ do not remember paths, only candidates
- ▶ often only one current candidate ~> very memory-efficient (however, not complete or optimal)
- ▶ often initialization with random candidate
- ▶ iterative improvement by hill climbing

Local Search: Hill Climbing

Hill Climbing

Hill Climbing (for Maximization Problems)

current := a random candidate

repeat:

next := a neighbor of current with maximum h value

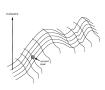

if $h(next) \leq h(current)$:

return current

current := next

Remarks:

- search as walk "uphill" in a landscape defined by the neighborhood relation
- ▶ heuristic values define "height" of terrain
- ▶ analogous algorithm for minimization problems also traditionally called "hill climbing" even though the metaphor does not fully fit

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

C1. Combinatorial Optimization: Introduction and Hill-Climbing

Summary

combinatorial optimization problems:

- find solution of good quality (objective value) among many candidates
- special cases:
 - pure search problems
 - pure optimization problems
- differences to state-space search: no actions, paths etc.; only "state" matters

often solved via local search:

consider one candidate (or a few) at a time; try to improve it iteratively

C2. Combinatorial Optimization: Advanced Techniques

Dealing with Local Optima

Example: Local Minimum in the 8 Queens Problem

local minimum:

- candidate has 1 conflict
- ▶ all neighbors have at least 2

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 2, 2025

C2. Combinatorial Optimization: Advanced Techniques

Dealing with Local Optima

Weaknesses of Local Search Algorithms

difficult situations for hill climbing:

- ▶ local optima: all neighbors worse than current candidate
- plateaus: many neighbors equally good as current candidate; none better

German: lokale Optima, Plateaus

consequence:

algorithm gets stuck at current candidate

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 2, 2025

C2. Combinatorial Optimization: Advanced Techniques

Dealing with Local Optima

Combating Local Optima

possible remedies to combat local optima:

- allow stagnation (steps without improvement)
- include random aspects in the search neighborhood
- ► (sometimes) make random steps
- breadth-first search to better candidate
- restarts (with new random initial candidate)

C2. Combinatorial Optimization: Advanced Techniques

Dealing with Local Optima

Allowing Stagnation

allowing stagnation:

- be do not terminate when no neighbor is an improvement
- limit number of steps to guarantee termination
- ▶ at end, return best visited candidate
 - pure search problems: terminate as soon as solution found

Example 8 queens problem:

- ▶ with a bound of 100 steps solution found in 96% of the cases
- on average 22 steps until solution found
- → works very well for this problem; for more difficult problems often not good enough

Random Aspects in the Search Neighborhood

a possible variation of hill climbing for 8 queens:

Randomly select a file; move queen in this file to square with minimal number of conflicts (null move possible).

 Good local search approaches often combine randomness (exploration) with heuristic guidance (exploitation).

German: Exploration, Exploitation

C2.2 Outlook: Simulated Annealing

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 2, 2025

C2. Combinatorial Optimization: Advanced Techniques

Outlook: Simulated Annealing

Simulated Annealing

Simulated annealing is a local search algorithm that systematically injects noise, beginning with high noise, then lowering it over time.

- \triangleright walk with fixed number of steps N (variations possible)
- initially it is "hot", and the walk is mostly random
- over time temperature drops (controlled by a schedule)
- ▶ as it gets colder, moves to worse neighbors become less likely

very successful in some applications, e.g., VLSI layout

German: simulierte Abkühlung, Rauschen

C2. Combinatorial Optimization: Advanced Techniques

Outlook: Simulated Annealing

Simulated Annealing: Pseudo-Code

```
Simulated Annealing (for Maximization Problems)
curr := a random candidate
best := none
for each t ∈ \{1, ..., N\}:
     if is_solution(curr) and (best is none or v(curr) > v(best)):
          best := curr
     T := schedule(t)
     next := a random neighbor of curr
     \Delta E := h(next) - h(curr)
     if \Delta E \geq 0 or with probability e^{\frac{\Delta E}{T}}:
          curr := next
return best
```

C2. Combinatorial Optimization: Advanced Techniques

Outlook: Genetic Algorithms

Outlook: Genetic Algorithms

Genetic Algorithms

C2. Combinatorial Optimization: Advanced Techniques

Evolution often finds good solutions.

idea: simulate evolution by selection, crossover and mutation of individuals

ingredients:

- encode each candidate as a string of symbols (genome)
- ► fitness function: evaluates strength of candidates (= heuristic)
- \triangleright population of k (e.g. 10–1000) individuals (candidates)

German: Evolution, Selektion, Kreuzung, Mutation, Genom, Fitnessfunktion, Population, Individuen

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

C2.3 Outlook: Genetic Algorithms

April 2, 2025

13 / 18

M. Helmert (University of Basel)

Foundations of Artificial Intelligence

April 2, 2025

C2. Combinatorial Optimization: Advanced Techniques

Outlook: Genetic Algorithms

Genetic Algorithm: Example

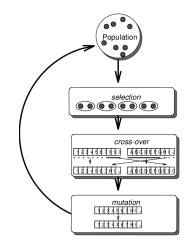

example 8 queens problem:

- genome: encode candidate as string of 8 numbers
- ▶ fitness: number of non-attacking queen pairs
- ▶ use population of 100 candidates

C2. Combinatorial Optimization: Advanced Techniques

Outlook: Genetic Algorithms

Selection, Mutation and Crossover

many variants:

How to select? How to perform crossover? How to mutate?

select according to fitness function, followed by pairing

determine crossover points, then recombine

mutation: randomly modify each string position with a certain probability

C2. Combinatorial Optimization: Advanced Techniques

Summary

- weakness of local search: local optima and plateaus
- remedy: balance exploration against exploitation (e.g., with randomness and restarts)
- ➤ simulated annealing and genetic algorithms are more complex search algorithms using the typical ideas of local search (randomization, keeping promising candidates)
