February 24, 2025 — B1. State-Space Search: State Spaces

B1.1 State-Space Search Problems

B1.2 Formalization

B1.3 State-Space Search

B1.4 Summary

State-Space Search: Overview

Chapter overview: state-space search

- ▶ B1–B3. Foundations
 - ▶ **B1. State Spaces**
 - ▶ B2. Representation of State Spaces
 - ▶ B3. Examples of State Spaces
- ▶ B4–B8. Basic Algorithms
- ▶ B9–B15. Heuristic Algorithms

B1.1 State-Space Search Problems

State-Space Search Applications

Mario AI competition

route planning

multi-agent path finding

scheduling

software/hardware verification

NPC behaviour

Classical Assumptions

“classical” assumptions considered in this part of the course:

- ▶ no other agents in the environment (**single-agent**)
 - ▶ always knows state of the world (**fully observable**)
 - ▶ state only changed by the agent (**static**)
 - ▶ finite number of states/actions (in particular **discrete**)
 - ▶ actions have **deterministic** effect on the state
- ↔ can all be generalized (but not in this part of the course)

Classification

classification:

State-Space Search
environment:

- ▶ **static** vs. **dynamic**
- ▶ **deterministic** vs. **nondeterministic** vs. **stochastic**
- ▶ **fully observable** vs. **partially observable**
- ▶ **discrete** vs. **continuous**
- ▶ **single-agent** vs. **multi-agent**

problem solving method:

- ▶ **problem-specific** vs. **general** vs. **learning**

Informal Description

State-space search problems are among the
“simplest” and most important classes of AI problems.

objective of the agent:

- ▶ apply a **sequence of actions**
- ▶ that reaches a **goal state**
- ▶ from a given **initial state**

performance measure: **minimize total action cost**

Motivating Example: 15-Puzzle

B1.2 Formalization

State Spaces

Definition (state space)

A **state space** or **transition system** is a 6-tuple $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$ with

- ▶ finite set of **states** S
- ▶ finite set of **actions** A
- ▶ **action costs** $cost : A \rightarrow \mathbb{R}_0^+$
- ▶ **transition relation** $T \subseteq S \times A \times S$ that is **deterministic in $\langle s, a \rangle$** (see next slide)
- ▶ **initial state** $s_1 \in S$
- ▶ set of **goal states** $S_G \subseteq S$

German: Zustandsraum, Transitionssystem, Zustände, Aktionen, Aktionskosten, Transitions-/Übergangsrelation, deterministisch, Anfangszustand, Zielzustände

State Spaces: Terminology & Notation

Definition (transition, deterministic)

Let $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$ be a state space.

The triples $\langle s, a, s' \rangle \in T$ are called **(state) transitions**.

We say \mathcal{S} **has the transition** $\langle s, a, s' \rangle$ if $\langle s, a, s' \rangle \in T$.

We write this as $s \xrightarrow{a} s'$, or $s \rightarrow s'$ when a does not matter.

Transitions are **deterministic** in $\langle s, a \rangle$: it is forbidden to have both $s \xrightarrow{a} s_1$ and $s \xrightarrow{a} s_2$ with $s_1 \neq s_2$.

State Space: Running Example

Consider the **bounded inc-and-square** search problem.

informal description:

- ▶ find a sequence of
 - ▶ **increment-mod10** (*inc*) and
 - ▶ **square-mod10** (*sqr*) actions
- ▶ on the natural numbers from 0 to 9
- ▶ that reaches the number 6 or 7
- ▶ starting from the number 1
- ▶ assuming each action costs 1.

formal model:

- ▶ $S = \{0, 1, \dots, 9\}$
- ▶ $A = \{inc, sqr\}$
- ▶ $cost(inc) = cost(sqr) = 1$
- ▶ T s.t. for $i = 0, \dots, 9$:
 - ▶ $\langle i, inc, (i + 1) \bmod 10 \rangle \in T$
 - ▶ $\langle i, sqr, i^2 \bmod 10 \rangle \in T$
- ▶ $s_1 = 1$
- ▶ $S_G = \{6, 7\}$

Graph Interpretation

state spaces are often depicted as **directed, labeled graphs**

- ▶ **states**: graph vertices
- ▶ **transitions**: labeled arcs (here: colors instead of labels)
- ▶ **initial state**: incoming arrow
- ▶ **goal states**: double circles
- ▶ **actions**: the arc labels
- ▶ **action costs**: described separately (or implicitly = 1)

State Spaces: More Terminology (1)

We use common terminology from graph theory.

Definition (predecessor, successor, applicable action)

Let $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$ be a state space.

Let $s, s' \in S$ be states with $s \rightarrow s'$.

- ▶ s is a **predecessor** of s'
- ▶ s' is a **successor** of s

If $s \xrightarrow{a} s'$, then action a is **applicable** in s .

German: Vorgänger, Nachfolger, anwendbar

State Spaces: More Terminology (2)

Definition (path)

Let $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$ be a state space.

Let $s_0, \dots, s_n \in S$ be states and $a_1, \dots, a_n \in A$ be actions such that $s_0 \xrightarrow{a_1} s_1, \dots, s_{(n-1)} \xrightarrow{a_n} s_n$.

- ▶ $\pi = \langle a_1, \dots, a_n \rangle$ is a **path** from s_0 to s_n
- ▶ **length** of π : $|\pi| = n$
- ▶ **cost** of π : $cost(\pi) = \sum_{i=1}^n cost(a_i)$

German: Pfad, Länge, Kosten

- ▶ paths may have length 0
- ▶ sometimes “path” is used for state sequence $\langle s_0, \dots, s_n \rangle$ or sequence $\langle s_0, a_1, s_1, \dots, s_{(n-1)}, a_n, s_n \rangle$

State Spaces: More Terminology (3)

More terminology:

Definition (reachable, solution, optimal)

Let $\mathcal{S} = \langle S, A, cost, T, s_I, S_G \rangle$ be a state space.

- ▶ state s is **reachable** if a path from s_I to s exists
- ▶ paths from $s \in S$ to some state $s_G \in S_G$ are **solutions for/from s**
- ▶ solutions for s_I are called **solutions for \mathcal{S}**
- ▶ **optimal solutions** (for s) have minimal costs among all solutions (for s)

German: erreichbar, Lösung für/von s , optimale Lösung

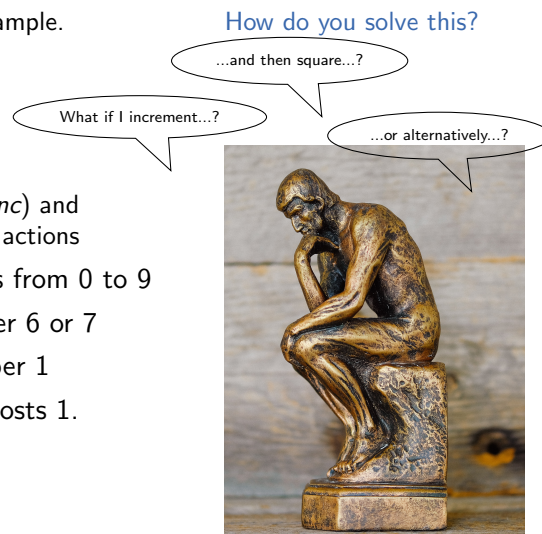

B1.3 State-Space Search

Solving Search Problems

Consider again the running example.

informal description:

- ▶ find a sequence of
 - ▶ **increment-mod10** (*inc*) and
 - ▶ **square-mod10** (*sqr*) actions
- ▶ on the natural numbers from 0 to 9
- ▶ that reaches the number 6 or 7
- ▶ starting from the number 1
- ▶ assuming each action costs 1.

State-Space Search

State-Space Search

State-space search is the algorithmic problem of finding solutions in state spaces or proving that no solution exists.

In **optimal** state-space search, only optimal solutions may be returned.

German: Zustandsraumsuche, optimale Zustandsraumsuche

Learning Objectives for State-Space Search

Learning Objectives for the Topic of State-Space Search

- ▶ **understanding state-space search:**
What is the problem and how can we formalize it?
- ▶ **evaluate search algorithms:**
completeness, optimality, time/space complexity
- ▶ **get to know search algorithms:**
uninformed vs. informed; tree and graph search
- ▶ **evaluate heuristics for search algorithms:**
goal-awareness, safety, admissibility, consistency
- ▶ **efficient implementation** of search algorithms
- ▶ **experimental evaluation** of search algorithms
- ▶ **design and comparison of heuristics** for search algorithms

B1.4 Summary

Summary

- ▶ **state-space search problems:**
find action sequence leading from initial state to a goal state
- ▶ **performance measure:** sum of action costs
- ▶ formalization via **state spaces:**
 - ▶ **states, actions, action costs, transitions, initial state, goal states**
- ▶ terminology for transitions, paths, solutions
- ▶ definition of (optimal) state-space search
