Foundations of Artificial Intelligence

February 26, 2025 — B2. State-Space Search: Representation of State Spaces

- B2.1 Representation of State Spaces
- **B2.2 Explicit Graphs**
- **B2.3 Declarative Representations**
- B2.4 Black Box
- B2.5 Summary

State-Space Search: Overview

Chapter overview: state-space search

- ▶ B1–B3. Foundations
 - ▶ B1. State Spaces
 - ▶ B2. Representation of State Spaces
 - B3. Examples of State Spaces
- ▶ B4-B8. Basic Algorithms
- ▶ B9–B15. Heuristic Algorithms

B2.1 Representation of State Spaces

Representation of State Spaces

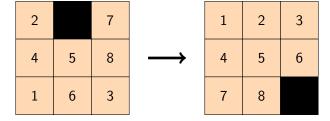

- practically interesting state spaces are often huge $(10^{10}, 10^{20}, 10^{100} \text{ states})$
- How do we represent them, so that we can efficiently deal with them algorithmically?

three main options:

- 1 as explicit (directed) graphs
- with declarative representations
- as a black box

German: explizit, deklarativ, Black Box

Example: 8-Puzzle

B2.2 Explicit Graphs

State Spaces as Explicit Graphs

State Spaces as Explicit Graphs

represent state spaces as explicit directed graphs:

- vertices = states
- directed arcs = transitions

→ represented as adjacency list or adjacency matrix

German: Adjazenzliste, Adjazenzmatrix

Example (explicit graph for bounded inc-and-square) ai-b02-bounded-inc-and-square.graph

State Spaces as Explicit Graphs

State Spaces as Explicit Graphs

represent state spaces as explicit directed graphs:

- vertices = states
- directed arcs = transitions

→ represented as adjacency list or adjacency matrix

German: Adjazenzliste, Adjazenzmatrix

Example (explicit graph for 8-puzzle) ai-b02-puzzle8.graph

State Spaces as Explicit Graphs: Discussion

discussion:

- impossible for large state spaces (too much space required)
- if spaces small enough for explicit representations, solutions easy to compute: Dijkstra's algorithm $O(|S| \log |S| + |T|)$
- ▶ interesting for time-critical all-pairs-shortest-path queries (examples: route planning, path planning in video games)

B2.3 Declarative Representations

State Spaces with Declarative Representations

State Spaces with Declarative Representations represent state spaces declaratively:

- compact description of state space as input to algorithms
 state spaces exponentially larger than the input
- algorithms directly operate on compact description
- allows automatic reasoning about problem: reformulation, simplification, abstraction, etc.

Example (declarative representation for 8-puzzle)
puzzle8-domain.pddl + puzzle8-problem.pddl

B2. State-Space Search: Representation of State Spaces

Black Box

B2.4 Black Box

State Spaces as Black Boxes

State Spaces as Black Boxes

Define an abstract interface for state spaces.

For state space $S = \langle S, A, cost, T, s_I, S_G \rangle$ we need these methods:

- init(): generate initial state result: state s₁
- ▶ is_goal(s): test if s is a goal state result: **true** if $s \in S_G$; **false** otherwise
- ▶ succ(s): generate applicable actions and successors of s result: sequence of pairs $\langle a, s' \rangle$ with $s \xrightarrow{a} s'$
- **►** cost(a): gives cost of action a result: cost(a) (∈ \mathbb{N}_0)

Remark: we will extend the interface later in a small but important way

State Spaces as Black Boxes: Example and Discussion

Example (Black Box Representation for 8-Puzzle) demo: puzzle8.py

- in the following: focus on black box model
- explicit graphs only as illustrating examples
- near end of semester: declarative state spaces (classical planning)

B2. State-Space Search: Representation of State Spaces

B2.5 Summary

Summary

- state spaces often huge (> 10¹⁰ states)
 → how to represent?
- explicit graphs: adjacency lists or matrices; only suitable for small problems
- declaratively: compact description as input to search algorithms
- black box: implement an abstract interface
