F3.4 Summary

# Automated Planning: Overview

## Chapter overview: automated planning

- ▶ F1. Introduction
- ▶ F2. Planning Formalisms
- ▶ F3. Delete Relaxation
- ▶ F4. Delete Relaxation Heuristics
- ▶ F5. Abstraction
- ▶ F6. Abstraction Heuristics

## F3.1 How to Design Heuristics?

# A Simple Planning Heuristic

The STRIPS planner (Fikes & Nilsson, 1971) uses the **number of goals not yet satisfied** in a STRIPS planning task as heuristic:

$$h(s) = |G \setminus s|.$$

**intuition:** fewer unsatisfied goals  $\rightsquigarrow$  closer to goal state

$\rightsquigarrow$  **STRIPS heuristic**

# Problems of STRIPS Heuristic

drawback of STRIPS heuristic?

- ▶ rather **uninformed**:

For state  $s$ , if there is no applicable action  $a$  in  $s$  such that applying  $a$  in  $s$  satisfies strictly more (or fewer) goals, then all successor states have the same heuristic value as  $s$ .

- ▶ ignores almost the whole **task structure**:

The heuristic values do not depend on the actions.

~> we need better methods to design heuristics

# Planning Heuristics

We consider **two basic ideas** for general heuristics:

- ▶ **delete relaxation**  $\rightsquigarrow$  this and next chapter
- ▶ **abstraction**  $\rightsquigarrow$  Chapters F5–F6

## Delete Relaxation: Basic Idea

Estimate solution costs by considering a **simplified planning task**, where all **negative action effects are ignored**.

## F3.2 Delete Relaxation

# Relaxed Planning Tasks: Idea

In STRIPS planning tasks,  
good and bad effects are easy to distinguish:

- ▶ Add effects are always useful.
- ▶ Delete effects are always harmful.

Why?

idea for designing heuristics: ignore all delete effects

# Relaxed Planning Tasks

## Definition (relaxation of actions)

The **relaxation**  $a^+$  of STRIPS action  $a$  is the action with

- ▶  $pre(a^+) = pre(a)$ ,
- ▶  $add(a^+) = add(a)$ ,
- ▶  $cost(a^+) = cost(a)$ , and
- ▶  $del(a^+) = \emptyset$ .

**German:** Relaxierung von Aktionen

## Definition (relaxation of planning tasks)

The **relaxation**  $\Pi^+$  of a STRIPS planning task  $\Pi = \langle V, I, G, A \rangle$  is the task  $\Pi^+ = \langle V, I, G, \{a^+ \mid a \in A\} \rangle$ .

**German:** Relaxierung von Planungsaufgaben

## Relaxed Planning Tasks: Terminology

- ▶ STRIPS planning tasks without delete effects are called **relaxed planning tasks** or **delete-free planning tasks**.
- ▶ Plans for relaxed planning tasks are called **relaxed plans**.
- ▶ If  $\Pi$  is a STRIPS planning task and  $\pi^+$  is a plan for  $\Pi^+$ , then  $\pi^+$  is called **relaxed plan for  $\Pi$** .

# Optimal Relaxation Heuristic

## Definition (optimal relaxation heuristic $h^+$ )

Let  $\Pi$  be a STRIPS planning task with the relaxation  $\Pi^+ = \langle V, I, G, A^+ \rangle$ .

The **optimal relaxation heuristic  $h^+$**  for  $\Pi$  maps each state  $s$  to the cost of an optimal plan for the planning task  $\langle V, s, G, A^+ \rangle$ .

In other words, the heuristic value for  $s$  is the optimal solution cost in the relaxation of  $\Pi$  with  $s$  as the initial state.

## F3.3 Examples

# Example: Logistics

## Example (Logistics Task)

- ▶ **variables:**  $V = \{at_{AL}, at_{AR}, at_{BL}, at_{BR}, at_{TL}, at_{TR}, in_{AT}, in_{BT}\}$
- ▶ **initial state:**  $I = \{at_{AL}, at_{BR}, at_{TL}\}$
- ▶ **goals:**  $G = \{at_{AR}, at_{BL}\}$
- ▶ **actions:**  $\{move_{LR}, move_{RL}, load_{AL}, load_{AR}, load_{BL}, load_{BR}, unload_{AL}, unload_{AR}, unload_{BL}, unload_{BR}\}$
- ▶ ...

## Example: Logistics

### Example (Logistics Task)

- ▶  $pre(move_{LR}) = \{at_{TL}\}$ ,  $add(move_{LR}) = \{at_{TR}\}$ ,  
 $del(move_{LR}) = \{at_{TL}\}$ ,  $cost(move_{LR}) = 1$
- ▶  $pre(load_{AL}) = \{at_{TL}, at_{AL}\}$ ,  $add(load_{AL}) = \{in_{AT}\}$ ,  
 $del(load_{AL}) = \{at_{AL}\}$ ,  $cost(load_{AL}) = 1$
- ▶  $pre(unload_{AL}) = \{at_{TL}, in_{AT}\}$ ,  $add(unload_{AL}) = \{at_{AL}\}$ ,  
 $del(unload_{AL}) = \{in_{AT}\}$ ,  $cost(unload_{AL}) = 1$
- ▶ ...

# Example: Logistics

► optimal plan:

- ①  $load_{AL}$
- ②  $move_{LR}$
- ③  $unload_{AR}$
- ④  $load_{BR}$
- ⑤  $move_{RL}$
- ⑥  $unload_{BL}$

► optimal relaxed plan: ?

►  $h^*(I) = 6$ ,  $h^+(I) = ?$

## Example: 8-Puzzle

- ▶ actual goal distance:  $h^*(s) = 17$
- ▶ Manhattan distance:  $h^{\text{MD}}(s) = 5$
- ▶ optimal delete relaxation:  $h^+(s) = 7$

relationship (no proof):

$h^+$  **dominates** the Manhattan distance in the sliding tile puzzle  
(i.e.,  $h^{\text{MD}}(s) \leq h^+(s) \leq h^*(s)$  for all states  $s$ )

# Relaxed Solutions: Suboptimal or Optimal?

- ▶ For general STRIPS planning tasks,  $h^+$  is an **admissible and consistent heuristic** (no proof).
- ▶ Can  $h^+$  be computed efficiently?
  - ▶ It is **easy** to solve delete-free planning tasks **suboptimally**. (**How?**)
  - ▶ optimal solution (and hence the computation of  $h^+$ ) is **NP-hard** (reduction from SET COVER)
- ▶ In practice, heuristics approximate  $h^+$  from below or above.

## F3.4 Summary

# Summary

## delete relaxation:

- ▶ ignore **negative effects** (delete effects) of actions
- ▶ use **solution costs of relaxed planning task** as **heuristic** for solution costs of the original planning task
- ▶ computation of optimal relaxed solution costs  $h^+$  is NP-hard, hence usually **approximated** from below or above
