### Theory of Computer Science B13. Type-1 and Type-0 Languages: Closure & Decidability

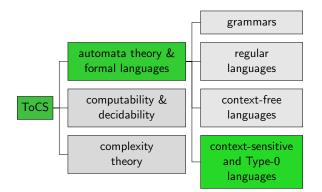

Gabriele Röger

University of Basel

April 9, 2025

Closure and Decidability 00000

### Content of the Course

# Turing Machines vs. Grammars

## **Turing Machines**

We have seen several variants of Turing machines:

- Deterministic TM with head movements left or right
- Deterministic TM with head movements left, right or neutral
- Multitape Turing machines
- Nondeterministic Turing machines

All variants recognize the same languages.

## **Turing Machines**

We have seen several variants of Turing machines:

- Deterministic TM with head movements left or right
- Deterministic TM with head movements left, right or neutral
- Multitape Turing machines
- Nondeterministic Turing machines

All variants recognize the same languages.

We mentioned earlier that we can relate Turing machines to the Type-1 and Type-0 languages.

### Reminder: Context-sensitive Grammar

Type-1 languages are also called context-sensitive languages.

### Definition (Context-sensitive Grammar)

A context-sensitive grammar is a 4-tuple  $\langle V, \Sigma, R, S \rangle$  with

- V finite set of variables (nonterminal symbols)
- $\Sigma$  finite alphabet of terminal symbols with  $V \cap \Sigma = \emptyset$
- R ⊆ (V ∪ Σ)\*V(V ∪ Σ)\* × (V ∪ Σ)\* finite set of rules, where all rules are of the form αBγ → αβγ with B ∈ V and α, γ ∈ (V ∪ Σ)\* and β ∈ (V ∪ Σ)<sup>+</sup>. Exception: S → ε is allowed if S never occurs on the right-hand side of a rule.
- $S \in V$  start variable.

Summary 000

### One Automata Model for Two Grammar Types?

Don't we need different automata models for context-sensitive and Type-0 languages?

Picture courtesy of stockimages / FreeDigitalPhotos.net

### Linear Bounded Automata: Idea

- Linear bounded automata are NTMs that may only use the part of the tape occupied by the input word.
- one way of formalizing this: NTMs where blank symbol may never be replaced by a different symbol

# Linear Bounded Turing Machines: Definition

### Definition (Linear Bounded Automata)

An NTM  $M = \langle Q, \Sigma, \Gamma, \delta, q_0, q_{accept}, q_{reject} \rangle$ is called a linear bounded automaton (LBA) if for all  $q \in Q \setminus \{q_{accept}, q_{reject}\}$  and all transition rules  $\langle q', c, y \rangle \in \delta(q, \Box)$  we have  $c = \Box$ .

German: linear beschränkte Turingmaschine

## LBAs Recognize Type-1 Languages

#### Theorem

The languages that can be recognized by linear bounded automata are exactly the context-sensitive (type-1) languages.

Without proof.

# LBAs Recognize Type-1 Languages

#### Theorem

The languages that can be recognized by linear bounded automata are exactly the context-sensitive (type-1) languages.

### Without proof.

### proof sketch for grammar $\Rightarrow$ NTM direction:

- computation of the NTM follows the production of the word in the grammar in opposite order
- accept when only the start symbol (and blanks) are left on the tape
- because the language is context-sensitive, we never need additional space on the tape (empty word needs special treatment)

### NTMs Recognize Type-0 Languages

#### Theorem

The languages that can be recognized by nondeterministic Turing machines are exactly the type-0 languages.

Without proof.

## NTMs Recognize Type-0 Languages

#### Theorem

The languages that can be recognized by nondeterministic Turing machines are exactly the type-0 languages.

Without proof.

proof sketch for grammar  $\Rightarrow$  NTM direction:

- analogous to previous proof
- for grammar rules  $w_1 \rightarrow w_2$  with  $|w_1| > |w_2|$ , we must "insert" symbols into the existing tape content; this is a bit tedious, but not very difficult

### What about the Deterministic Variants?

We know that DTMs and NTMs recognize the same languages. Hence:

### Corollary

The Turing-recognizable languages are exactly the Type-0 languages.

## What about the Deterministic Variants?

We know that DTMs and NTMs recognize the same languages. Hence:

#### Corollary

The Turing-recognizable languages are exactly the Type-0 languages.

Note: It is an open problem whether deterministic LBAs can recognize exactly the type-1 languages.

Turing Machines vs. Grammars

# Questions

Closure and Decidability

Summary 000

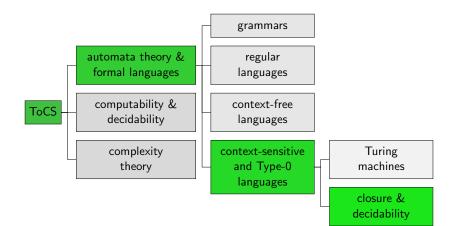

### Questions?

# **Closure Properties and Decidability**

Closure and Decidability

### Content of the Course

### **Closure Properties**

	Intersection	Union	Complement	Concatenation	Star
Type 3	Yes	Yes	Yes	Yes	Yes
Type 2	No	Yes	No	Yes	Yes
Type 1	Yes <sup>(2)</sup>	$Yes^{(1)}$	Yes <sup>(2)</sup>	Yes <sup>(1)</sup>	Yes <sup>(1)</sup>
Type 0	Yes <sup>(2)</sup>	$Yes^{(1)}$	No <sup>(3)</sup>	Yes <sup>(1)</sup>	$Yes^{(1)}$

### Proofs?

(1) proof via grammars, similar to context-free cases

(2) without proof

(3) proof in later chapters (part C)

Turing Machines vs. Grammars

Closure and Decidability 00000

### Decidability

	Word problem	Emptiness problem	Equivalence problem	Intersection problem
Type 3	Yes	Yes	Yes	Yes
Type 2	Yes	Yes	No	No
Type 1	Yes <sup>(1)</sup>	No <sup>(3)</sup>	No <sup>(2)</sup>	No <sup>(2)</sup>
Type 0	No <sup>(4)</sup>	No <sup>(4)</sup>	No <sup>(2)</sup>	No <sup>(2)</sup>

Proofs?

(1) same argument we used for context-free languages

(2) because already undecidable for context-free languages

(3) without proof

(4) proofs in later chapters (part C)

### Questions?

Closure and Decidability

# Summary

### Summary

- Turing machines recognize exactly the type-0 languages.
- Linear bounded automata recognize exactly the context-sensitive languages.
- The context-sensitive and type-0 languages are closed under almost all usual operations.
  - exception: type-0 not closed under complement
- For context-sensitive and type-0 languages almost no problem is decidable.
  - exception: word problem for context-sensitive lang. decidable

### What's Next?

### contents of this course:

A. background  $\checkmark$ 

b mathematical foundations and proof techniques

- B. automata theory and formal languages √▷ What is a computation?
- C. Turing computability

▷ What can be computed at all?

D. complexity theory

▷ What can be computed efficiently?

- E. more computability theory
  - > Other models of computability
