Turing-Computable Functions

Hello World

```
def hello_world(name):
    return "Hello " + name + "!"
```

Hello World

```
def hello_world(name):
    return "Hello " + name + "!"
```

When calling hello_world("David") we get the result "Hello David!".

How could a Turing machine output a string as the result of a computation?

Church-Turing Thesis

Church-Turing Thesis

All functions that can be computed in the intuitive sense can be computed by a Turing machine.

 Talks about arbitrary functions that can be computed in the intutive sense.

Church-Turing Thesis

- Talks about arbitrary functions that can be computed in the intutive sense.
- So far, we have only considered recognizability and decidability: Is a word in a language, yes or no?

Church-Turing Thesis

- Talks about arbitrary functions that can be computed in the intutive sense.
- So far, we have only considered recognizability and decidability: Is a word in a language, yes or no?
- We now will consider function values beyond yes or no (accept or reject).

Church-Turing Thesis

- Talks about arbitrary functions that can be computed in the intutive sense.
- So far, we have only considered recognizability and decidability: Is a word in a language, yes or no?
- We now will consider function values beyond yes or no (accept or reject).
- ⇒ consider the tape content when the TM accepted.

Computation

In the following we investigate models of computation for partial functions $f: \mathbb{N}_0^k \to_{p} \mathbb{N}_0$.

 no real limitation: arbitrary information can be encoded as numbers

Reminder: Configurations and Computation Steps

How do Turing Machines Work?

- **configuration**: $\langle \alpha, q, \beta \rangle$ with $\alpha \in \Gamma^*$, $q \in Q$, $\beta \in \Gamma^+$
- one computation step: $c \vdash c'$ if one computation step can turn configuration c into configuration c'
- multiple computation steps: $c \vdash^* c'$ if 0 or more computation steps can turn configuration c into configuration c' $(c = c_0 \vdash c_1 \vdash c_2 \vdash \cdots \vdash c_{n-1} \vdash c_n = c', n \ge 0)$

(Definition of \vdash , i.e., how a computation step changes the configuration, is not repeated here. \leadsto Chapter B11)

Computation of Functions?

How can a DTM compute a function?

- "Input" x is the initial tape content.
- "Output" f(x) is the tape content (ignoring blanks at the right) when reaching the accept state.
- If the TM stops in the reject state or does not stop for the given input, f(x) is undefined for this input.

Which kinds of functions can be computed this way?

- directly, only functions on words: $f: \Sigma^* \to_p \Sigma^*$
- interpretation as functions on numbers $f: \mathbb{N}_0^k \to_p \mathbb{N}_0$: encode numbers as words

Turing Machines: Computed Function

Definition (Function Computed by a Turing Machine)

A DTM $M = \langle Q, \Sigma, \Gamma, \delta, q_0, q_{\mathsf{accept}}, q_{\mathsf{reject}} \rangle$ computes the (partial) function $f : \Sigma^* \to_{\mathsf{p}} \Sigma^*$ for which for all $x, y \in \Sigma^*$:

$$f(x) = y \text{ iff } \langle \varepsilon, q_0, x \rangle \vdash^* \langle \varepsilon, q_{\mathsf{accept}}, y \square \dots \square \rangle.$$

(special case: initial configuration $\langle \varepsilon, q_0, \square \rangle$ if $x = \varepsilon$)

- What happens if the computation does not reach q_{accept} ?
- What happens if symbols from $\Gamma \setminus \Sigma$ (e.g., \square) occur in y?
- What happens if the read-write head is not at the first tape cell when accepting?
- Is f uniquely defined by this definition? Why?

German: DTM berechnet f

Turing-Computable Functions on Words

Definition (Turing-Computable, $f: \Sigma^* \to_{p} \Sigma^*$)

A (partial) function $f: \Sigma^* \to_p \Sigma^*$ is called Turing-computable if a DTM that computes f exists.

German: Turing-berechenbar

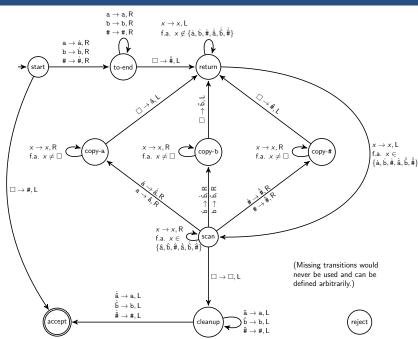

Example: Turing-Computable Functions on Words

Example

Let $\Sigma = \{a, b, \#\}$.

The function $f: \Sigma^* \to_p \Sigma^*$ with f(w) = w # w for all $w \in \Sigma^*$ is Turing-computable.

Idea: blackboard

Questions

Questions?

Turing-Computable Numerical Functions

- We now transfer the concept to partial functions $f: \mathbb{N}_0^k \to_{\mathsf{p}} \mathbb{N}_0$.
- Idea:
 - To represent a number as a word, we use its binary representation (= a word over $\{0,1\}$).
 - To represent tuples of numbers, we separate the binary representations with symbol #.
- For example: (5, 2, 3) becomes 101#10#11

Encoding Numbers as Words

Definition (Encoded Function)

Let $f: \mathbb{N}_0^k \to_{\mathsf{p}} \mathbb{N}_0$ be a (partial) function.

The encoded function f^{code} of f is the partial function $f^{\text{code}}: \Sigma^* \to_{\mathbf{p}} \Sigma^*$ with $\Sigma = \{0, 1, \#\}$ and $f^{\text{code}}(w) = w'$ iff

- lacksquare there are $n_1,\ldots,n_k,n'\in\mathbb{N}_0$ such that
- $f(n_1,\ldots,n_k)=n',$
- $\mathbf{w} = bin(n_1) \# \dots \# bin(n_k)$ and
- $\mathbf{w}' = bin(n').$

Here $bin : \mathbb{N}_0 \to \{0,1\}^*$ is the binary encoding (e.g., bin(5) = 101).

Example: f(5,2,3) = 4 corresponds to $f^{\text{code}}(101\#10\#11) = 100$.

German: codierte Funktion

Turing-Computable Numerical Functions

Definition (Turing-Computable, $f: \mathbb{N}_0^k \to_{p} \mathbb{N}_0$)

A (partial) function $f: \mathbb{N}_0^k \to_p \mathbb{N}_0$ is called Turing-computable if a DTM that computes f^{code} exists.

German: Turing-berechenbar

Exercise

The addition of natural numbers $+: \mathbb{N}_0^2 \to \mathbb{N}_0$ is Turing-computable. You have a TM M that computes $+^{\mathsf{code}}$.

You want to use M to compute the sum 3 + 2. What is your input to M?

Example: Turing-Computable Numerical Function

Example

The following numerical functions are Turing-computable:

•
$$succ : \mathbb{N}_0 \to_{\mathsf{p}} \mathbb{N}_0$$
 with $succ(n) := n + 1$

$$lackbox{$lackbox{$\ pred}_2: \mathbb{N}_0 \to_{\mathsf{p}} \mathbb{N}_0$ with $pred_2(n):= } \begin{cases} n-1 & \text{if $n \geq 1$} \\ \text{undefined} & \text{if $n = 0$} \end{cases}$$

Example: Turing-Computable Numerical Function

Example

The following numerical functions are Turing-computable:

- $succ : \mathbb{N}_0 \to_{\mathsf{p}} \mathbb{N}_0$ with succ(n) := n + 1
- $pred_1 : \mathbb{N}_0 \to_{\mathsf{p}} \mathbb{N}_0$ with $pred_1(n) := \begin{cases} n-1 & \text{if } n \geq 1 \\ 0 & \text{if } n = 0 \end{cases}$ $pred_2 : \mathbb{N}_0 \to_{\mathsf{p}} \mathbb{N}_0$ with $pred_2(n) := \begin{cases} n-1 & \text{if } n \geq 1 \\ \text{undefined} & \text{if } n = 0 \end{cases}$

How does incrementing and decrementing binary numbers work?

Successor Function

The Turing machine for *succ* works as follows:

(Details of marking the first tape position ommitted)

- Oheck that the input is a valid binary number:
 - If the input is not a single symbol 0 but starts with a 0, reject.
 - If the input contains symbol #, reject.
- Move the head onto the last symbol of the input.
- While you read a 1 and you are not at the first tape position, replace it with a 0 and move the head one step to the left.
- Depending on why the loop in stage 3 terminated:
 - If you read a 0, replace it with a 1, move the head to the left end of the tape and accept.
 - If you read a 1 at the first tape position, move every non-blank symbol on the tape one position to the right, write a 1 in the first tape position and accept.

Predecessor Function

The Turing machine for $pred_1$ works as follows:

(Details of marking the first tape position ommitted)

- Check that the input is a valid binary number (as for *succ*).
- ② If the (entire) input is 0 or 1, write a 0 and accept.
- Move the head onto the last symbol of the input.
- While you read symbol 0 replace it with 1 and move left.
- Replace the 1 with a 0.
- If you are on the first tape cell, eliminate the trailing 0 (moving all other non-blank symbols one position to the left).
- Move the head to the first position and accept.

Predecessor Function

The Turing machine for $pred_1$ works as follows:

(Details of marking the first tape position ommitted)

- Check that the input is a valid binary number (as for *succ*).
- ② If the (entire) input is 0 or 1, write a 0 and accept.
- Move the head onto the last symbol of the input.
- While you read symbol 0 replace it with 1 and move left.
- Replace the 1 with a 0.
- If you are on the first tape cell, eliminate the trailing 0 (moving all other non-blank symbols one position to the left).
- Move the head to the first position and accept.

What do you have to change to get a TM for pred₂?

More Turing-Computable Numerical Functions

Example

The following numerical functions are Turing-computable:

- \blacksquare add: $\mathbb{N}_0^2 \rightarrow_{\mathsf{p}} \mathbb{N}_0$ with add $(n_1, n_2) := n_1 + n_2$
- $sub : \mathbb{N}_0^2 \to_{\mathsf{p}} \mathbb{N}_0$ with $sub(n_1, n_2) := \max\{n_1 n_2, 0\}$
- lacksquare $mul: \mathbb{N}_0^2
 ightarrow_p \mathbb{N}_0$ with $mul(n_1, n_2) := n_1 \cdot n_2$

→ sketch?

Questions

Questions?

Decidability vs. Computability

Decidability as Computability

Theorem

A language $L \subseteq \Sigma^*$ is decidable iff $\chi_L : \Sigma^* \to \{0, 1\}$, the characteristic function of L, is computable.

Here, for all $w \in \Sigma^*$:

$$\chi_L(w) := \begin{cases} 1 & \text{if } w \in L \\ 0 & \text{if } w \notin L \end{cases}$$

Decidability as Computability

Theorem

A language $L \subseteq \Sigma^*$ is decidable iff $\chi_L : \Sigma^* \to \{0, 1\}$, the characteristic function of L, is computable.

Here, for all $w \in \Sigma^*$:

$$\chi_L(w) := \begin{cases} 1 & \text{if } w \in L \\ 0 & \text{if } w \notin L \end{cases}$$

Proof sketch.

" \Rightarrow " Let M be a DTM for L. Construct a DTM M' that simulates M on the input. If M accepts, M' writes a 1 on the tape. If M rejects, M' writes a 0 on the tape. Afterwards M' accepts.

Decidability as Computability

Theorem

A language $L \subseteq \Sigma^*$ is decidable iff $\chi_L : \Sigma^* \to \{0, 1\}$, the characteristic function of L, is computable.

Here, for all $w \in \Sigma^*$:

$$\chi_L(w) := \begin{cases} 1 & \text{if } w \in L \\ 0 & \text{if } w \notin L \end{cases}$$

Proof sketch.

" \Rightarrow " Let M be a DTM for L. Construct a DTM M' that simulates M on the input. If M accepts, M' writes a 1 on the tape. If M rejects, M' writes a 0 on the tape. Afterwards M' accepts. " \Leftarrow " Let C be a DTM that computes χ_L . Construct a DTM C' that simulates C on the input. If the output of C is 1 then C' accepts, otherwise it rejects.

Turing-recognizable Languages and Computability

Theorem

A language $L\subseteq \Sigma^*$ is Turing-recognizable iff the following function $\chi'_L:\Sigma^*\to_p\{0,1\}$ is computable.

Here, for all $w \in \Sigma^*$:

$$\chi'_{L}(w) = \begin{cases} 1 & \text{if } w \in L \\ \text{undefined} & \text{if } w \notin L \end{cases}$$

Turing-recognizable Languages and Computability

Theorem

A language $L \subseteq \Sigma^*$ is Turing-recognizable iff the following function $\chi'_L : \Sigma^* \to_p \{0,1\}$ is computable.

Here, for all $w \in \Sigma^*$:

$$\chi'_{L}(w) = \begin{cases} 1 & \text{if } w \in L \\ undefined & \text{if } w \notin L \end{cases}$$

Proof sketch.

" \Rightarrow " Let M be a DTM for L. Construct a DTM M' that simulates M on the input. If M accepts, M' writes a 1 on the tape and accepts. Otherwise it enters an infinite loop.

Turing-recognizable Languages and Computability

Theorem

A language $L \subseteq \Sigma^*$ is Turing-recognizable iff the following function $\chi'_L : \Sigma^* \to_p \{0,1\}$ is computable.

Here, for all $w \in \Sigma^*$:

$$\chi'_{L}(w) = \begin{cases} 1 & \text{if } w \in L \\ \text{undefined} & \text{if } w \notin L \end{cases}$$

Proof sketch.

" \Rightarrow " Let M be a DTM for L. Construct a DTM M' that simulates M on the input. If M accepts, M' writes a 1 on the tape and accepts. Otherwise it enters an infinite loop.

" \leftarrow " Let C be a DTM that computes χ'_L . Construct a DTM C' that simulates C on the input. If C accepts with output 1 then C' accepts, otherwise it enters an infinite loop.

Questions

Questions?

Summary

Summary

- Turing-computable function $f: \Sigma^* \to_p \Sigma^*$: there is a DTM that transforms every input $w \in \Sigma^*$ into the output f(w) (undefined if DTM does not stop or stops in invalid configuration)
- Turing-computable function $f: \mathbb{N}_0^k \to_p \mathbb{N}_0$: ditto; numbers encoded in binary and separated by #
