# State-Space Search: Overview

## Chapter overview: state-space search

- ▶ B1–B3. Foundations
  - ▶ **B1. State Spaces**
  - ▶ B2. Representation of State Spaces
  - ▶ B3. Examples of State Spaces
- ▶ B4–B8. Basic Algorithms
- ▶ B9–B15. Heuristic Algorithms

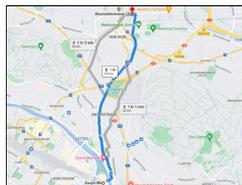

# B1.1 State-Space Search Problems

## State-Space Search Applications

Mario AI competition

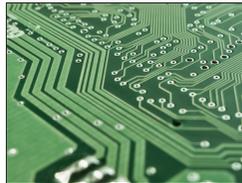

route planning

multi-agent path finding

scheduling

software/hardware verification

NPC behaviour

## Classical Assumptions

“classical” assumptions considered in this part of the course:

- ▶ no other agents in the environment (**single-agent**)
  - ▶ always knows state of the world (**fully observable**)
  - ▶ state only changed by the agent (**static**)
  - ▶ finite number of states/actions (in particular **discrete**)
  - ▶ actions have **deterministic** effect on the state
- ↔ can all be generalized (but not in this part of the course)

## Classification

classification:

State-Space Search  
environment:

- ▶ **static** vs. **dynamic**
- ▶ **deterministic** vs. **nondeterministic** vs. **stochastic**
- ▶ **fully observable** vs. **partially observable**
- ▶ **discrete** vs. **continuous**
- ▶ **single-agent** vs. **multi-agent**

problem solving method:

- ▶ **problem-specific** vs. **general** vs. **learning**

## Informal Description

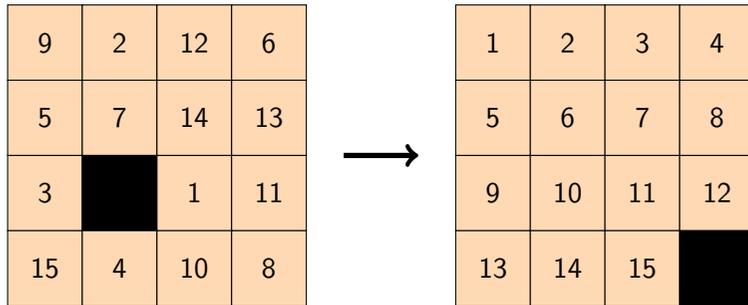

State-space search problems are among the  
“simplest” and **most important** classes of AI problems.

objective of the agent:

- ▶ apply a **sequence of actions**
- ▶ that reaches a **goal state**
- ▶ from a given **initial state**

performance measure: **minimize total action cost**

## Motivating Example: 15-Puzzle

## B1.2 Formalization

## State Spaces

### Definition (state space)

A **state space** or **transition system** is a 6-tuple  $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$  with

- ▶ finite set of **states**  $S$
- ▶ finite set of **actions**  $A$
- ▶ **action costs**  $cost : A \rightarrow \mathbb{R}_0^+$
- ▶ **transition relation**  $T \subseteq S \times A \times S$  that is **deterministic in  $\langle s, a \rangle$**  (see next slide)
- ▶ **initial state**  $s_1 \in S$
- ▶ set of **goal states**  $S_G \subseteq S$

**German:** Zustandsraum, Transitionssystem, Zustände, Aktionen, Aktionskosten, Transitions-/Übergangsrelation, deterministisch, Anfangszustand, Zielzustände

## State Spaces: Terminology & Notation

### Definition (transition, deterministic)

Let  $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$  be a state space.

The triples  $\langle s, a, s' \rangle \in T$  are called **(state) transitions**.

We say  $\mathcal{S}$  **has the transition**  $\langle s, a, s' \rangle$  if  $\langle s, a, s' \rangle \in T$ .

We write this as  $s \xrightarrow{a} s'$ , or  $s \rightarrow s'$  when  $a$  does not matter.

Transitions are **deterministic** in  $\langle s, a \rangle$ : it is forbidden to have both  $s \xrightarrow{a} s_1$  and  $s \xrightarrow{a} s_2$  with  $s_1 \neq s_2$ .

## State Space: Running Example

Consider the **bounded inc-and-square** search problem.

informal description:

- ▶ find a sequence of
  - ▶ **increment-mod10** (*inc*) and
  - ▶ **square-mod10** (*sqr*) actions
- ▶ on the natural numbers from 0 to 9
- ▶ that reaches the number 6 or 7
- ▶ starting from the number 1
- ▶ assuming each action costs 1.

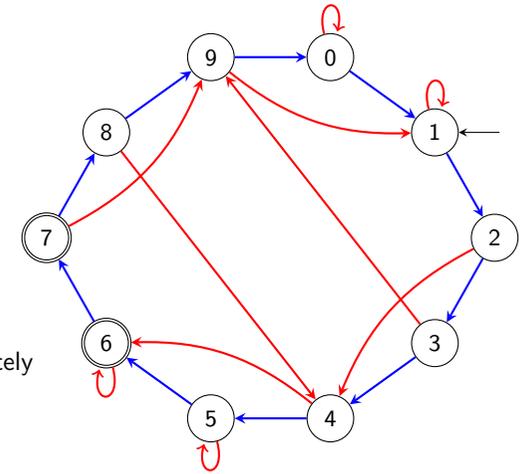

formal model:

- ▶  $S = \{0, 1, \dots, 9\}$
- ▶  $A = \{inc, sqr\}$
- ▶  $cost(inc) = cost(sqr) = 1$
- ▶  $T$  s.t. for  $i = 0, \dots, 9$ :
  - ▶  $\langle i, inc, (i + 1) \bmod 10 \rangle \in T$
  - ▶  $\langle i, sqr, i^2 \bmod 10 \rangle \in T$
- ▶  $s_1 = 1$
- ▶  $S_G = \{6, 7\}$

## Graph Interpretation

state spaces are often depicted as **directed, labeled graphs**

- ▶ **states**: graph vertices
- ▶ **transitions**: labeled arcs (here: colors instead of labels)
- ▶ **initial state**: incoming arrow
- ▶ **goal states**: double circles
- ▶ **actions**: the arc labels
- ▶ **action costs**: described separately (or implicitly = 1)

## State Spaces: More Terminology (1)

We use common terminology from graph theory.

**Definition (predecessor, successor, applicable action)**

Let  $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$  be a state space.

Let  $s, s' \in S$  be states with  $s \rightarrow s'$ .

- ▶  $s$  is a **predecessor** of  $s'$
- ▶  $s'$  is a **successor** of  $s$

If  $s \xrightarrow{a} s'$ , then action  $a$  is **applicable** in  $s$ .

**German**: Vorgänger, Nachfolger, anwendbar

## State Spaces: More Terminology (2)

**Definition (path)**

Let  $\mathcal{S} = \langle S, A, cost, T, s_1, S_G \rangle$  be a state space.

Let  $s_0, \dots, s_n \in S$  be states and  $a_1, \dots, a_n \in A$  be actions such that  $s_0 \xrightarrow{a_1} s_1, \dots, s_{(n-1)} \xrightarrow{a_n} s_n$ .

- ▶  $\pi = \langle a_1, \dots, a_n \rangle$  is a **path** from  $s_0$  to  $s_n$
- ▶ **length** of  $\pi$ :  $|\pi| = n$
- ▶ **cost** of  $\pi$ :  $cost(\pi) = \sum_{i=1}^n cost(a_i)$

**German**: Pfad, Länge, Kosten

- ▶ paths may have length 0
- ▶ sometimes “path” is used for state sequence  $\langle s_0, \dots, s_n \rangle$  or sequence  $\langle s_0, a_1, s_1, \dots, s_{(n-1)}, a_n, s_n \rangle$

## State Spaces: More Terminology (3)

More terminology:

**Definition (reachable, solution, optimal)**

Let  $\mathcal{S} = \langle S, A, cost, T, s_I, S_G \rangle$  be a state space.

- ▶ state  $s$  is **reachable** if a path from  $s_I$  to  $s$  exists
- ▶ paths from  $s \in S$  to some state  $s_G \in S_G$  are **solutions for/from  $s$**
- ▶ solutions for  $s_I$  are called **solutions for  $\mathcal{S}$**
- ▶ **optimal solutions** (for  $s$ ) have minimal costs among all solutions (for  $s$ )

**German:** erreichbar, Lösung für/von  $s$ , optimale Lösung

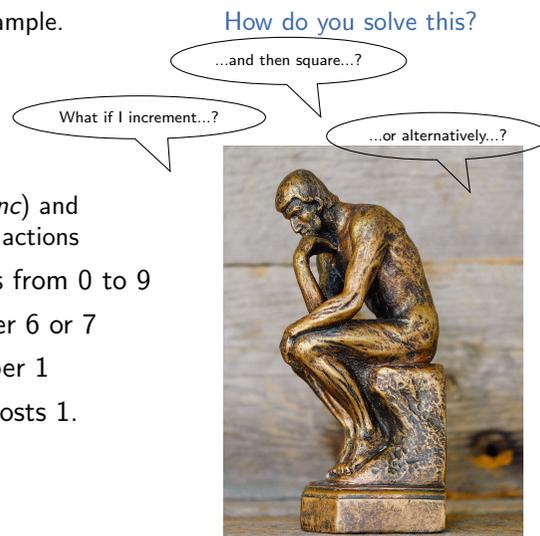

## B1.3 State-Space Search

## Solving Search Problems

Consider again the running example.

**informal description:**

- ▶ find a sequence of
  - ▶ **increment-mod10** (*inc*) and
  - ▶ **square-mod10** (*sqr*) actions
- ▶ on the natural numbers from 0 to 9
- ▶ that reaches the number 6 or 7
- ▶ starting from the number 1
- ▶ assuming each action costs 1.

## State-Space Search

**State-Space Search**

**State-space search** is the algorithmic problem of finding solutions in state spaces or proving that no solution exists.

In **optimal** state-space search, only optimal solutions may be returned.

**German:** Zustandsraumsuche, optimale Zustandsraumsuche

## Learning Objectives for State-Space Search

### Learning Objectives for the Topic of State-Space Search

- ▶ **understanding state-space search:**  
What is the problem and how can we formalize it?
- ▶ **evaluate search algorithms:**  
completeness, optimality, time/space complexity
- ▶ **get to know search algorithms:**  
uninformed vs. informed; tree and graph search
- ▶ **evaluate heuristics for search algorithms:**  
goal-awareness, safety, admissibility, consistency
- ▶ **efficient implementation** of search algorithms
- ▶ **experimental evaluation** of search algorithms
- ▶ **design and comparison of heuristics** for search algorithms

## B1.4 Summary

## Summary

- ▶ **state-space search problems:**  
find action sequence leading from initial state to a goal state
- ▶ **performance measure:** sum of action costs
- ▶ formalization via **state spaces:**
  - ▶ **states, actions, action costs, transitions, initial state, goal states**
- ▶ terminology for transitions, paths, solutions
- ▶ definition of (optimal) state-space search
