Foundations of Artificial Intelligence

March 16, 2026 — B8. State-Space Search: Depth-first Search & Iterative Deepening

B8.1 Depth-first Search

B8.2 Iterative Deepening

B8.3 Summary

State-Space Search: Overview

Chapter overview: state-space search

- ▶ B1–B3. Foundations
- ▶ B4–B8. Basic Algorithms
 - ▶ B4. Data Structures for Search Algorithms
 - ▶ B5. Tree Search and Graph Search
 - ▶ B6. Breadth-first Search
 - ▶ B7. Uniform Cost Search
 - ▶ B8. Depth-first Search and Iterative Deepening
- ▶ B9–B15. Heuristic Algorithms

B8.1 Depth-first Search

Idea of Depth-first Search

depth-first search:

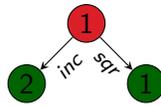

- ▶ expands nodes in **opposite order of generation** (LIFO)
- ▶ open list implemented as **stack**
- ↔ **deepest** node expanded first

German: Tiefensuche

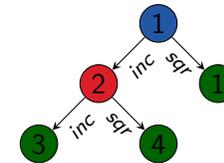

Depth-first Search Example

Non-recursive Depth-first Search: Discussion

discussion:

- ▶ there isn't much wrong with this pseudo-code (as long as we ensure to release nodes that are no longer required when using programming languages without garbage collection)
- ▶ however, depth-first search as a **recursive algorithm** is simpler and more efficient
- ↪ CPU stack as implicit open list
- ↪ no search node data structure needed

Depth-first Search (Recursive Version)

```
function depth_first_search(s)
  if is_goal(s):
    return {}
  for each ⟨a, s'⟩ ∈ succ(s):
    solution := depth_first_search(s')
    if solution ≠ none:
      solution.push_front(a)
      return solution
  return none
```

main function:

```
Depth-first Search (Recursive Version)
return depth_first_search(init())
```

Depth-first Search: Complexity

time complexity:

- ▶ If the state space includes paths of length m , depth-first search can generate $O(b^m)$ nodes, even if much shorter solutions (e.g., of length 1) exist.
- ▶ On the other hand: in the **best case**, solutions of length ℓ can be found with $O(b\ell)$ generated nodes. (Why?)
- ▶ improvable to $O(\ell)$ with **incremental successor generation**

space complexity:

- ▶ only need to store nodes **along currently explored path** ("along": nodes on path and their children)
- ↪ space complexity $O(bm)$ if m maximal search depth reached
- ▶ low memory complexity main reason why depth-first search interesting despite its disadvantages

B8.2 Iterative Deepening

Idea of Depth-limited Search

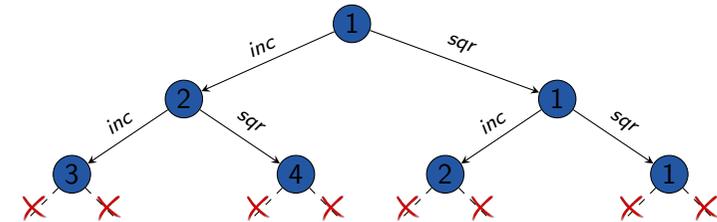

depth-limited search:

- ▶ parameterized with **depth limit** $\ell \in \mathbb{N}_0$
- ▶ behaves like depth-first search, but **prunes** (does not expand) search nodes at depth ℓ
- ▶ not very useful on its own, but **important ingredient** of more useful algorithms

German: tiefenbeschränkte Suche

Depth-limited Search Example

Consider depth limit $\ell = 2$.

Depth-limited Search: Pseudo-Code

```

function depth_limited_search(s, depth_limit):
  if is_goal(s):
    return ⟨⟩
  if depth_limit > 0:
    for each ⟨a, s'⟩ ∈ succ(s):
      solution := depth_limited_search(s', depth_limit - 1)
      if solution ≠ none:
        solution.push_front(a)
    return solution
  return none
  
```

Iterative Deepening Depth-first Search

iterative deepening depth-first search (iterative deepening DFS):

- ▶ **idea**: perform a sequence of depth-limited searches with increasing depth limit
- ▶ sounds wasteful (each iteration repeats all the useful work of all previous iterations)
- ▶ in fact overhead acceptable (\rightsquigarrow analysis follows)

Iterative Deepening DFS

```

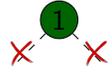

for depth_limit ∈ {0, 1, 2, ...}:
  solution := depth_limited_search(init(), depth_limit)
  if solution ≠ none:
    return solution
  
```

German: iterative Tiefensuche

Example

depth limit: 0

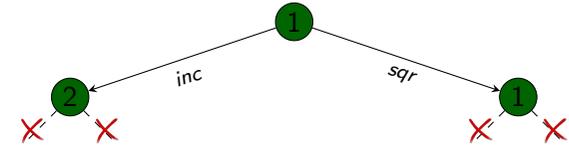

generated nodes: 1

Example

depth limit: 1

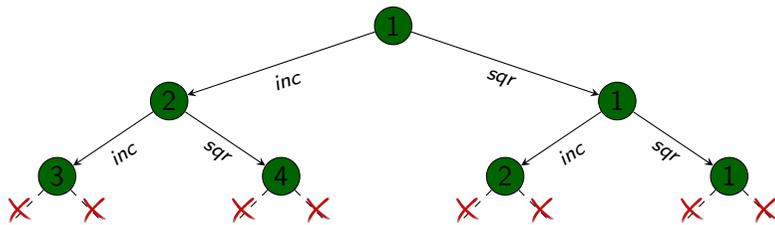

generated nodes: 1+3

Example

depth limit: 2

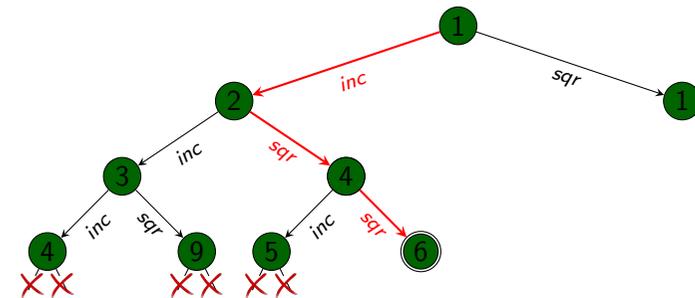

generated nodes: 1+3+7

Example

depth limit: 3

generated nodes: 1+3+7+9=20

Iterative Deepening DFS: Properties

combines advantages of breadth-first and depth-first search:

- ▶ (almost) like BFS: **semi-complete** (however, not complete)
- ▶ like BFS: **optimal** if all actions have same cost
- ▶ like DFS: only need to store nodes along one path
 \rightsquigarrow space complexity $O(bd)$, where d minimal solution length
- ▶ time complexity only slightly higher than BFS
 $(\rightsquigarrow$ analysis soon)

Iterative Deepening DFS: Complexity Example

time complexity (generated nodes):

breadth-first search	$1 + b + b^2 + \dots + b^{d-1} + b^d$
iterative deepening DFS	$(d + 1) + db + (d - 1)b^2 + \dots + 2b^{d-1} + 1b^d$

example: $b = 10, d = 5$

breadth-first search	$1 + 10 + 100 + 1000 + 10000 + 100000$ = 111111
iterative deepening DFS	$6 + 50 + 400 + 3000 + 20000 + 100000$ = 123456

for $b = 10$, only 11% more nodes than breadth-first search

Iterative Deepening DFS: Time Complexity

Theorem (time complexity of iterative deepening DFS)

Let b be the branching factor and d be the minimal solution length of the given state space. Let $b \geq 2$.

Then the **time complexity** of iterative deepening DFS is

$$(d + 1) + db + (d - 1)b^2 + (d - 2)b^3 + \dots + 1b^d = O(b^d)$$

and the **memory complexity** is

$$O(bd).$$

Iterative Deepening DFS: Evaluation

Iterative Deepening DFS: Evaluation

Iterative Deepening DFS is often the method of choice if

- ▶ **tree search is adequate** (no duplicate elimination necessary),
- ▶ all **action costs** are identical, and
- ▶ the **solution depth is unknown**.

B8.3 Summary

Summary

depth-first search: expand nodes in LIFO order

- ▶ usually as a tree search
- ▶ easy to implement recursively
- ▶ very memory-efficient
- ▶ can be combined with iterative deepening to combine many of the good aspects of breadth-first and depth-first search

Comparison of Blind Search Algorithms

completeness, optimality, time and space complexity

criterion	search algorithm				
	breadth-first	uniform cost	depth-first	depth-limited	iterative deepening
complete?	yes*	yes	no	no	semi
optimal?	yes**	yes	no	no	yes**
time	$O(b^d)$	$O(b^{\lfloor c^*/\epsilon \rfloor + 1})$	$O(b^m)$	$O(b^\ell)$	$O(b^d)$
space	$O(b^d)$	$O(b^{\lfloor c^*/\epsilon \rfloor + 1})$	$O(bm)$	$O(b\ell)$	$O(bd)$

$b \geq 2$ branching factor
 d minimal solution depth
 m maximal search depth
 ℓ depth limit
 c^* optimal solution cost
 $\epsilon > 0$ minimal action cost

remarks:

* for BFS-Tree: semi-complete
 ** only with uniform action costs
