Abstractions

Abstracting a Transition System

Abstracting a transition system means **dropping some distinctions** between states, while **preserving the transition behaviour** as much as possible.

- An abstraction of a transition system \mathcal{T} is defined by an **abstraction mapping** α that defines which states of \mathcal{T} should be distinguished and which ones should not.
- From \mathcal{T} and α , we compute an **abstract transition system** \mathcal{T}^α which is similar to \mathcal{T} , but smaller.
- The **abstract goal distances** (goal distances in \mathcal{T}^α) are used as heuristic estimates for goal distances in \mathcal{T} .

Computing the Abstract Transition System

Given \mathcal{T} and α , how do we compute \mathcal{T}^α ?

Requirement

We want to obtain an **admissible heuristic**.

Hence, $h^*(\alpha(s))$ (in the abstract state space \mathcal{T}^α) should never overestimate $h^*(s)$ (in the concrete state space \mathcal{T}).

An easy way to achieve this is to ensure that **all solutions in \mathcal{T} are also present in \mathcal{T}^α** :

- If s is a goal state in \mathcal{T} , then $\alpha(s)$ is a goal state in \mathcal{T}^α .
- If \mathcal{T} has a transition from s to t , then \mathcal{T}^α has a transition from $\alpha(s)$ to $\alpha(t)$.

Example Task: One Package, Two Trucks

Example (One Package, Two Trucks)

Consider the following FDR planning task $\langle V, I, O, \gamma \rangle$:

- $V = \{p, t_A, t_B\}$ with
 - $\text{dom}(p) = \{L, R, A, B\}$
 - $\text{dom}(t_A) = \text{dom}(t_B) = \{L, R\}$
- $I = \{p \mapsto L, t_A \mapsto R, t_B \mapsto R\}$
- $O = \{\text{pickup}_{i,j} \mid i \in \{A, B\}, j \in \{L, R\}\}$
 $\cup \{\text{drop}_{i,j} \mid i \in \{A, B\}, j \in \{L, R\}\}$
 $\cup \{\text{move}_{i,j,j'} \mid i \in \{A, B\}, j, j' \in \{L, R\}, j \neq j'\}$, where
 - $\text{pickup}_{i,j} = \langle t_i = j \wedge p = j, p := i, 1 \rangle$
 - $\text{drop}_{i,j} = \langle t_i = j \wedge p = i, p := j, 1 \rangle$
 - $\text{move}_{i,j,j'} = \langle t_i = j, t_i := j', 1 \rangle$
- $\gamma = (p = R)$

Concrete Transition System of Example Task

- State $\{p \mapsto i, t_A \mapsto j, t_B \mapsto k\}$ is depicted as ijk .
- Transition labels are again not shown. For example, the transition from LLL to ALL has the label $\text{pickup}_{A,L}$.

Abstract Transition System of Example Task

- State $\{p \mapsto i, t_A \mapsto j, t_B \mapsto k\}$ is depicted as ijk .
- Transition labels are again not shown. For example, the transition from LLL to ALL has the label $\text{pickup}_{A,L}$.

Abstractions

Definition (Abstraction)

Let $\mathcal{T} = \langle S, L, c, T, s_0, S_\star \rangle$ be a transition system.

An **abstraction** (also: **abstraction** function, **abstraction mapping**) of \mathcal{T} is a function $\alpha : S \rightarrow S^\alpha$ defined on the states of \mathcal{T} , where S^α is an arbitrary set.

Without loss of generality, we require that α is surjective.

Intuition: α maps the states of \mathcal{T} to another (usually smaller) **abstract** state space.

Abstract Transition System

Definition (Abstract Transition System)

Let $\mathcal{T} = \langle S, L, c, T, s_0, S_\star \rangle$ be a transition system,
and let $\alpha : S \rightarrow S^\alpha$ be an abstraction of \mathcal{T} .

The **abstract transition system induced by α** , in symbols \mathcal{T}^α ,
is the transition system $\mathcal{T}^\alpha = \langle S^\alpha, L, c, T^\alpha, s_0^\alpha, S_\star^\alpha \rangle$ defined by:

- $T^\alpha = \{ \langle \alpha(s), \ell, \alpha(t) \rangle \mid \langle s, \ell, t \rangle \in T \}$
- $s_0^\alpha = \alpha(s_0)$
- $S_\star^\alpha = \{ \alpha(s) \mid s \in S_\star \}$

Terminology

Let \mathcal{T} be a transition system and α be an abstraction of \mathcal{T} .

- \mathcal{T} is called the **concrete transition system**.
- \mathcal{T}^α is called the **abstract transition system**.
- Similarly: **concrete/abstract state space**,
concrete/abstract transition, etc.

Practical Requirements for Abstractions

To be useful in practice, an abstraction heuristic must be efficiently computable. This gives us two requirements for α :

- For a given state s , the **abstract state** $\alpha(s)$ must be efficiently computable.
- For a given abstract state $\alpha(s)$, the **abstract goal distance** $h^*(\alpha(s))$ must be efficiently computable.

There are a number of ways of achieving these requirements:

- **pattern database heuristics** (Culberson & Schaeffer, 1996)
- **merge-and-shrink abstractions** (Dräger, Finkbeiner & Podelski, 2006)
- Cartesian abstractions (Ball, Podelski & Rajamani, 2001)
- structural patterns (Katz & Domshlak, 2008b)

Homomorphisms and Isomorphisms

Homomorphisms and Isomorphisms

- The abstraction mapping α that transforms \mathcal{T} to \mathcal{T}^α is also called a **strict homomorphism** from \mathcal{T} to \mathcal{T}^α .
- Roughly speaking, in mathematics a **homomorphism** is a property-preserving mapping between structures.
- A **strict** homomorphism is one where no additional features are introduced. A non-strict homomorphism in planning would mean that the abstract transition system may include additional transitions and goal states not induced by α .
- We only consider strict homomorphisms in this course.
- If α is bijective, it is called an **isomorphism** between \mathcal{T} and \mathcal{T}^α , and the two transition systems are called **isomorphic**.

Isomorphic Transition Systems

The notion of isomorphic transition systems is important enough to warrant a formal definition:

Definition (Isomorphic Transition Systems)

Let $\mathcal{T} = \langle S, L, c, T, s_0, S_\star \rangle$ and $\mathcal{T}' = \langle S', L', c', T', s'_0, S'_\star \rangle$ be transition systems.

We say that \mathcal{T} is **isomorphic to** \mathcal{T}' , in symbols $\mathcal{T} \sim \mathcal{T}'$, if there exist bijective functions $\varphi : S \rightarrow S'$ and $\lambda : L \rightarrow L'$ such that:

- $s \xrightarrow{\ell} t \in T$ iff $\varphi(s) \xrightarrow{\lambda(\ell)} \varphi(t) \in T'$,
- $c'(\lambda(\ell)) = c(\ell)$ for all $\ell \in L$,
- $\varphi(s_0) = s'_0$, and
- $s \in S_\star$ iff $\varphi(s) \in S'_\star$.

Graph-Equivalent Transition Systems

Sometimes a weaker notion of equivalence is useful:

Definition (Graph-Equivalent Transition Systems)

Let $\mathcal{T} = \langle S, L, c, T, s_0, S_\star \rangle$ and $\mathcal{T}' = \langle S', L', c', T', s'_0, S'_\star \rangle$ be transition systems.

We say that \mathcal{T} is **graph-equivalent to** \mathcal{T}' , in symbols $\mathcal{T} \stackrel{G}{\sim} \mathcal{T}'$, if there exists a bijective function $\varphi : S \rightarrow S'$ such that:

- There is a transition $s \xrightarrow{\ell} t \in T$ with $c(\ell) = k$ iff there is a transition $\varphi(s) \xrightarrow{\ell'} \varphi(t) \in T'$ with $c'(\ell') = k$,
- $\varphi(s_0) = s'_0$, and
- $s \in S_\star$ iff $\varphi(s) \in S'_\star$.

Note: The labels of \mathcal{T} and \mathcal{T}' do not matter except that transitions **of the same cost** must be preserved.

Isomorphism vs. Graph Equivalence

- (\sim) and $(\overset{\mathcal{G}}{\sim})$ are equivalence relations.
- Two isomorphic transition systems are interchangeable for all practical intents and purposes.
- Two graph-equivalent transition systems are interchangeable for most intents and purposes.
- In particular, their goal distances are identical.
- Isomorphism implies graph equivalence, but not vice versa.

Abstraction Heuristics

Abstraction Heuristics

Definition (Abstraction Heuristic)

Let $\alpha : S \rightarrow S^\alpha$ be an abstraction of a transition system \mathcal{T} .

The **abstraction heuristic induced by α** , written h^α , is the heuristic function $h^\alpha : S \rightarrow \mathbb{R}_0^+ \cup \{\infty\}$ defined as

$$h^\alpha(s) = h_{\mathcal{T}^\alpha}^*(\alpha(s)) \quad \text{for all } s \in S,$$

where $h_{\mathcal{T}^\alpha}^*$ denotes the goal distance function in \mathcal{T}^α .

Notes:

- $h^\alpha(s) = \infty$ if no goal state of \mathcal{T}^α is reachable from $\alpha(s)$
- We also apply abstraction terminology to planning tasks Π , which stand for their induced transition systems.
For example, an **abstraction of Π** is an abstraction of $\mathcal{T}(\Pi)$.

Abstraction Heuristics: Example

$$h^\alpha(\{p \mapsto L, t_A \mapsto R, t_B \mapsto R\}) = 3$$

Consistency of Abstraction Heuristics (1)

Theorem (Consistency and Admissibility of h^α)

Let α be an abstraction of a transition system \mathcal{T} .

Then h^α is safe, goal-aware, admissible and consistent.

Proof.

We prove goal-awareness and consistency;
the other properties follow from these two.

Let $\mathcal{T} = \langle S, L, c, T, s_0, S_\star \rangle$.

Let $\mathcal{T}^\alpha = \langle S^\alpha, L, c, T^\alpha, s_0^\alpha, S_\star^\alpha \rangle$.

Consistency of Abstraction Heuristics (1)

Theorem (Consistency and Admissibility of h^α)

Let α be an abstraction of a transition system \mathcal{T} .

Then h^α is safe, goal-aware, admissible and consistent.

Proof.

We prove goal-awareness and consistency;
the other properties follow from these two.

Let $\mathcal{T} = \langle S, L, c, T, s_0, S_\star \rangle$.

Let $\mathcal{T}^\alpha = \langle S^\alpha, L, c, T^\alpha, s_0^\alpha, S_\star^\alpha \rangle$.

Goal-awareness: We need to show that $h^\alpha(s) = 0$ for all $s \in S_\star$,
so let $s \in S_\star$. Then $\alpha(s) \in S_\star^\alpha$ by the definition of abstract
transition systems, and hence $h^\alpha(s) = h_{\mathcal{T}^\alpha}^*(\alpha(s)) = 0$

Consistency of Abstraction Heuristics (2)

Proof (continued).

Consistency: Consider any state transition $s \xrightarrow{\ell} t$ of \mathcal{T} .
We need to show $h^\alpha(s) \leq c(\ell) + h^\alpha(t)$.

Consistency of Abstraction Heuristics (2)

Proof (continued).

Consistency: Consider any state transition $s \xrightarrow{\ell} t$ of \mathcal{T} .

We need to show $h^\alpha(s) \leq c(\ell) + h^\alpha(t)$.

By the definition of \mathcal{T}^α , we get $\alpha(s) \xrightarrow{\ell} \alpha(t) \in \mathcal{T}^\alpha$.

Hence, $\alpha(t)$ is a successor of $\alpha(s)$ in \mathcal{T}^α via the label ℓ .

Consistency of Abstraction Heuristics (2)

Proof (continued).

Consistency: Consider any state transition $s \xrightarrow{\ell} t$ of \mathcal{T} .
We need to show $h^\alpha(s) \leq c(\ell) + h^\alpha(t)$.

By the definition of \mathcal{T}^α , we get $\alpha(s) \xrightarrow{\ell} \alpha(t) \in \mathcal{T}^\alpha$.
Hence, $\alpha(t)$ is a successor of $\alpha(s)$ in \mathcal{T}^α via the label ℓ .

We get:

$$\begin{aligned} h^\alpha(s) &= h_{\mathcal{T}^\alpha}^*(\alpha(s)) \\ &\leq c(\ell) + h_{\mathcal{T}^\alpha}^*(\alpha(t)) \\ &= c(\ell) + h^\alpha(t), \end{aligned}$$

where the inequality holds because perfect goal distances $h_{\mathcal{T}^\alpha}^*$ are consistent in \mathcal{T}^α .

(The shortest path from $\alpha(s)$ to the goal in \mathcal{T}^α cannot be longer than the shortest path from $\alpha(s)$ to the goal via $\alpha(t)$.) □

Coarsenings and Refinements

Abstractions of Abstractions

Since abstractions map transition systems to transition systems, they are **composable**:

- Using a first abstraction $\alpha : S \rightarrow S'$, map \mathcal{T} to \mathcal{T}^α .
- Using a second abstraction $\beta : S' \rightarrow S''$, map \mathcal{T}^α to $(\mathcal{T}^\alpha)^\beta$.

The result is **the same** as directly using the abstraction $(\beta \circ \alpha)$:

- Let $\gamma : S \rightarrow S''$ be defined as $\gamma(s) = (\beta \circ \alpha)(s) = \beta(\alpha(s))$.
- Then $\mathcal{T}^\gamma = (\mathcal{T}^\alpha)^\beta$.

Abstractions of Abstractions: Example (1)

transition system \mathcal{T}

Abstractions of Abstractions: Example (2)

Transition system \mathcal{T}' as an abstraction of \mathcal{T}
(ignore t_B)

Abstractions of Abstractions: Example (2)

Transition system \mathcal{T}' as an abstraction of \mathcal{T}
(ignore t_B)

Abstractions of Abstractions: Example (3)

Transition system \mathcal{T}'' as an abstraction of \mathcal{T}'
(ignore t_A)

Abstractions of Abstractions: Example (3)

Transition system \mathcal{T}'' as an abstraction of \mathcal{T}
(ignore t_A and t_B)

Coarsenings and Refinements

Definition (Coarsening and Refinement)

Let α and γ be abstractions of the same transition system such that $\gamma = \beta \circ \alpha$ for some function β .

Then γ is called a **coarsening** of α and α is called a **refinement** of γ .

Heuristic Quality of Refinements

Theorem (Heuristic Quality of Refinements)

Let α and γ be abstractions of the same transition system such that α is a refinement of γ .

Then h^α dominates h^γ .

In other words, $h^\gamma(s) \leq h^\alpha(s) \leq h^*(s)$ for all states s .

Heuristic Quality of Refinements: Proof

Proof.

Since α is a refinement of γ ,
there exists a function β with $\gamma = \beta \circ \alpha$.

For all states s of Π , we get:

$$\begin{aligned}h^\gamma(s) &= h_{\mathcal{T}^\gamma}^*(\gamma(s)) \\ &= h_{\mathcal{T}^\gamma}^*(\beta(\alpha(s))) \\ &= h_{\mathcal{T}^\alpha}^\beta(\alpha(s)) \\ &\leq h_{\mathcal{T}^\alpha}^*(\alpha(s)) \\ &= h^\alpha(s),\end{aligned}$$

where the inequality holds because $h_{\mathcal{T}^\alpha}^\beta$ is an admissible heuristic in the transition system \mathcal{T}^α . □

Summary

Summary

- **Abstraction** is one of the principled ways of deriving heuristics.
- An **abstraction** is a function α that maps the states S of a transition system to another (usually smaller) set S^α .
- This **induces** an abstract transition system \mathcal{T}^α , which behaves like the original transition system \mathcal{T} except that states mapped to the same abstract state cannot be distinguished.
- Abstractions α induce **abstraction heuristics** h^α : $h^\alpha(s)$ is the goal distance of $\alpha(s)$ in the abstract transition system.
- Abstraction heuristics are **safe, goal-aware, admissible** and **consistent**.
- Abstractions can be composed, leading to **coarser** vs. **finer** abstractions. Heuristics for finer abstractions dominate those for coarser ones.
