Content of this Course

Goals for Today

Today:

- ► introduce a mathematical model for planning tasks: transition systems
- ► introduce compact representations for planning tasks suitable as input for planning algorithms

A3. Transition Systems and Propositional Logic

Transition Systems

Transition System Example

Transition systems are often depicted as directed arc-labeled graphs with decorations to indicate the initial state and goal states.

M. Helmert, T. Keller (Universität Basel)

Planning and Optimization

A3. Transition Systems and Propositional Logic

Transition Systems

Transition Systems

Definition (Transition System)

A transition system is a 6-tuple $\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle$ where

- ► *S* is a finite set of states,
- L is a finite set of (transition) labels,
- $ightharpoonup c: L o \mathbb{R}_0^+$ is a label cost function,
- ▶ $T \subseteq S \times L \times S$ is the transition relation,
- $ightharpoonup s_0 \in S$ is the initial state, and
- ▶ $S_{\star} \subseteq S$ is the set of goal states.

We say that \mathcal{T} has the transition $\langle s, \ell, s' \rangle$ if $\langle s, \ell, s' \rangle \in \mathcal{T}$.

We also write this as $s \xrightarrow{\ell} s'$, or $s \rightarrow s'$ when not interested in ℓ .

Note: Transition systems are also called state spaces.

A3. Transition Systems and Propositional Logic

Transition Systems

Deterministic Transition Systems

Definition (Deterministic Transition System)

A transition system is called deterministic if for all states s and all labels ℓ , there is at most one state s' with $s \xrightarrow{\ell} s'$.

Example: previously shown transition system

Transition Systems

Transition System Terminology (1)

We use common terminology from graph theory:

- ightharpoonup s' successor of s if $s \to s'$
- ightharpoonup s predecessor of s' if $s \rightarrow s'$

M. Helmert, T. Keller (Universität Basel)

Planning and Optimization

September 23, 2019

A3. Transition Systems and Propositional Logic

Transition Systems

Transition System Terminology (3)

We use common terminology from graph theory:

- ➤ s' reachable (without reference state) means reachable from initial state s₀
- **solution** or goal path from s: path from s to some $s' \in S_*$
 - ▶ if s is omitted, $s = s_0$ is implied
- transition system solvable if a goal path from s₀ exists

A3. Transition Systems and Propositional Logic

Transition Systems

Transition System Terminology (2)

We use common terminology from graph theory:

- ▶ s' reachable from s if there exists a sequence of transitions $s^0 \xrightarrow{\ell_1} s^1, \ldots, s^{n-1} \xrightarrow{\ell_n} s^n$ s.t. $s^0 = s$ and $s^n = s'$
 - Note: n = 0 possible; then s = s'
 - $ightharpoonup s^0, \ldots, s^n$ is called (state) path from s to s'
 - \blacktriangleright ℓ_1, \ldots, ℓ_n is called (label) path from s to s'
 - $ightharpoonup s^0 \xrightarrow{\ell_1} s^1, \ldots, s^{n-1} \xrightarrow{\ell_n} s^n$ is called trace from s to s'
 - ▶ length of path/trace is *n*
 - cost of label path/trace is $\sum_{i=1}^{n} c(\ell_i)$

Example: Blocks World

Running Example: Blocks World

- ► Throughout the course, we occasionally use the blocks world domain as an example.
- ► In the blocks world, a number of different blocks are arranged on a table.
- Our job is to rearrange them according to a given goal.

M. Helmert, T. Keller (Universität Basel)

Planning and Optimization

13 / 27

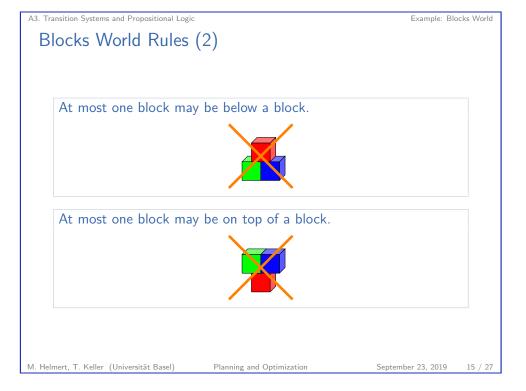

A3. Transition Systems and Propositional Logic

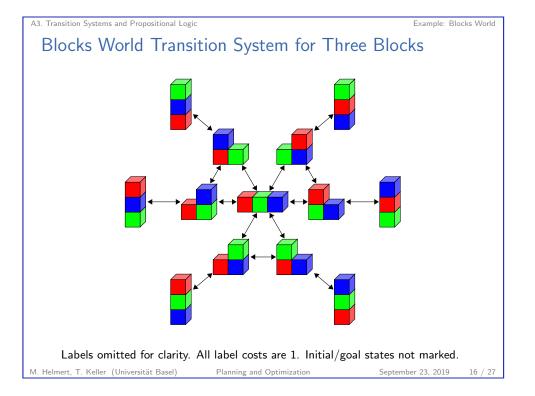

Blocks World Rules (1)

Location on the table does not matter.

Location on a block does not matter.

Location on a block does not matter.

Example: Blocks World

Blocks World Computational Properties

blocks	states	blocks	states
1	1	10	58941091
2	3	11	824073141
3	13	12	12470162233
4	73	13	202976401213
5	501	14	3535017524403
6	4051	15	65573803186921
7	37633	16	1290434218669921
8	394353	17	26846616451246353
9	4596553	18	588633468315403843

- ► Finding solutions is possible in linear time in the number of blocks: move everything onto the table, then construct the goal configuration.
- ► Finding a shortest solution is NP-complete given a compact description of the problem.

M. Helmert, T. Keller (Universität Basel)

A3. Transition Systems and Propositional Logic

Example: Blocks World

The Need for Compact Descriptions

- ➤ We see from the blocks world example that transition systems are often far too large to be directly used as inputs to planning algorithms.
- ▶ We therefore need compact descriptions of transition systems.
- ► For this purpose, we will use propositional logic, which allows expressing information about 2ⁿ states as logical formulas over *n* state variables.

M. Helmert, T. Keller (Universität Basel)

Reminder: Propositional Logic

Syntax of Propositional Logic

Definition (Logical Formula)

Let A be a set of atomic propositions.

The logical formulas over A are constructed by finite application of the following rules:

- ightharpoonup and ightharpoonup are logical formulas (truth and falsity).
- ▶ For all $a \in A$, a is a logical formula (atom).
- ▶ If φ is a logical formula, then so is $\neg \varphi$ (negation).
- \blacktriangleright If φ and ψ are logical formulas, then so are $(\varphi \lor \psi)$ (disjunction) and $(\varphi \land \psi)$ (conjunction).

M. Helmert, T. Keller (Universität Basel)

Planning and Optimization

September 23, 2019

A3. Transition Systems and Propositional Logic

Reminder: Propositional Logic

Syntactical Conventions for Propositional Logic

Abbreviations:

- \blacktriangleright $(\varphi \to \psi)$ is short for $(\neg \varphi \lor \psi)$ (implication)
- $(\varphi \leftrightarrow \psi)$ is short for $((\varphi \rightarrow \psi) \land (\psi \rightarrow \varphi))$ (equijunction)
- parentheses omitted when not necessary:
 - ▶ (¬) binds more tightly than binary connectives
 - (∧) binds more tightly than (∨), which binds more tightly than (\rightarrow) , which binds more tightly than (\leftrightarrow)

A3. Transition Systems and Propositional Logic

Reminder: Propositional Logic

Semantics of Propositional Logic

Definition (Valuation, Model)

A valuation of propositions A is a function $v : A \to \{T, F\}$.

Define the notation $v \models \varphi$ (v satisfies φ ; v is a model of φ ; φ is true under v) for valuations v and formulas φ by

- \triangleright $v \models \top$
- \triangleright $v \not\models \bot$
- $\triangleright v \models a$ iff $v(a) = \mathbf{T}$ (for all $a \in A$)
- $\triangleright v \models \neg \varphi$ iff $v \not\models \varphi$
- \triangleright $v \models (\varphi \lor \psi)$ iff $(v \models \varphi \text{ or } v \models \psi)$
- \triangleright $v \models (\varphi \land \psi)$ iff $(v \models \varphi \text{ and } v \models \psi)$

Note: Valuations are also called interpretations or truth assignments.

A3. Transition Systems and Propositional Logic

Reminder: Propositional Logic

Propositional Logic Terminology (1)

- \triangleright A logical formula φ is satisfiable if there is at least one valuation v such that $v \models \varphi$.
- Otherwise it is unsatisfiable
- \triangleright A logical formula φ is valid or a tautology if $v \models \varphi$ for all valuations v.
- \blacktriangleright A logical formula ψ is a logical consequence of a logical formula φ , written $\varphi \models \psi$, if $v \models \psi$ for all valuations v with $v \models \varphi$.
- \blacktriangleright Two logical formulas φ and ψ are logically equivalent, written $\varphi \equiv \psi$, if $\varphi \models \psi$ and $\psi \models \varphi$.

Question: How to phrase these in terms of models?

M. Helmert, T. Keller (Universität Basel)

Planning and Optimization

September 23, 2019

Reminder: Propositional Logic

Propositional Logic Terminology (2)

- A logical formula that is a proposition a or a negated proposition $\neg a$ for some atomic proposition $a \in A$ is a literal.
- A formula that is a disjunction of literals is a clause. This includes unit clauses ℓ consisting of a single literal and the empty clause \perp consisting of zero literals.
- A formula that is a conjunction of literals is a monomial. This includes unit monomials ℓ consisting of a single literal and the empty monomial \top consisting of zero literals.

Normal forms:

- ▶ negation normal form (NNF)
- conjunctive normal form (CNF)
- disjunctive normal form (DNF)

A3. Transition Systems and Propositional Logic

Summa

Summary

- ► Transition systems are (typically huge) directed graphs that encode how the state of the world can change.
- Propositional logic allows us to compactly describe complex information about large sets of valuations as logical formulas.
