## Efficiency of SAT Planning

- All other things being equal, the most important aspect for efficient SAT solving is the number of propositional variables in the input formula.
- For sufficiently difficult inputs, runtime scales exponentially in the number of variables.
- ∼→ Can we make SAT planning more efficient by using fewer variables?

B6. SAT Planning: Parallel Encoding

Introduction

#### Number of Variables

#### Reminder:

- given propositional planning task  $\Pi = \langle V, I, O, \gamma \rangle$
- ▶ given horizon  $T \in \mathbb{N}_0$

#### Variables of the SAT Formula

- ▶ propositional variables  $v^i$  for all  $v \in V$ ,  $0 \le i \le T$  encode state after i steps of the plan
- ▶ propositional variables  $o^i$  for all  $o \in O$ ,  $1 \le i \le T$  encode operator(s) applied in i-th step of the plan
- $\rightarrow$   $|V| \cdot (T+1) + |O| \cdot T$  variables
- $\rightarrow$  SAT solving runtime usually exponential in T

B6. SAT Planning: Parallel Encoding

Introduction

#### Parallel Plans and Interference

Can we get away with shorter horizons?

#### Idea:

allow parallel plans in the SAT encoding: multiple operators can be applied in the same step if they do not interfere

#### Definition (Interference)

Let  $O' = \{o_1, \dots, o_n\}$  be a set of operators applicable in state s.

We say that O' is interference-free in s if

- for all permutations  $\pi$  of O',  $s[\pi]$  is defined, and
- for all permutations  $\pi$ ,  $\pi'$  of O',  $s[\pi] = s[\pi']$ .

We say that O' interfere in s if they are not interference-free in s.

B6. SAT Planning: Parallel Encoding

Introduction

#### Parallel Plan Extraction

- ▶ If we can rule out interference, we can allow multiple operators at the same time in the SAT encoding.
- ► A parallel plan (with multiple  $o^i$  used for the same i) extracted from the SAT formula can then be converted into a "regular" plan by ordering the operators within each time step arbitrarily.

## Challenges for Parallel SAT Encodings

#### Two challenges remain:

- our current SAT encoding does not allow concurrent operators
- ▶ how do we ensure that our plans are interference-free?

Adapting the SAT Encoding

B6. SAT Planning: Parallel Encoding

Adapting the SAT Encoding

## Reminder: Sequential SAT Encoding (1)

## Sequential SAT Formula (1)

initial state clauses:

 $\sim v^0$ 

for all  $v \in V$  with  $I(v) = \mathbf{T}$ 

 $\rightarrow \neg v^0$ 

for all  $v \in V$  with  $I(v) = \mathbf{F}$ 

goal clauses:

 $\triangleright \gamma^T$ 

operator selection clauses:

 $\triangleright$   $o_1^i \vee \cdots \vee o_n^i$ 

for all  $1 \le i \le T$ 

operator exclusion clauses:

 $\neg o_i^i \lor \neg o_k^i$ 

for all  $1 \le i \le T$ ,  $1 \le j < k \le n$ 

→ operator exclusion clauses must be adapted

B6. SAT Planning: Parallel Encoding

Adapting the SAT Encoding

## Sequential SAT Encoding (2)

Sequential SAT Formula (2)

precondition clauses:

 $ightharpoonup o^i 
ightharpoonup pre(o)^{i-1}$ 

for all 1 < i < T,  $o \in O$ 

positive and negative effect clauses:

 $\bullet$   $(o^i \wedge \alpha^{i-1}) \rightarrow v^i$  for all 1 < i < T,  $o \in O$ ,  $v \in V$ 

 $\bullet$   $(o^i \wedge \delta^{i-1} \wedge \neg \alpha^{i-1}) \rightarrow \neg v^i$  for all 1 < i < T,  $o \in O$ ,  $v \in V$ 

positive and negative frame clauses:

 $\bullet$   $(o^i \wedge v^{i-1} \wedge \neg v^i) \rightarrow \delta^{i-1}$  for all 1 < i < T,  $o \in O$ ,  $v \in V$ 

 $\bullet$   $(o^i \land \neg v^{i-1} \land v^i) \rightarrow \alpha^{i-1}$  for all 1 < i < T,  $o \in O$ ,  $v \in V$ 

where  $\alpha = effcond(v, eff(o)), \delta = effcond(\neg v, eff(o)).$

Adapting the SAT Encoding

Adapting the Operator Exclusion Clauses: Idea

Reminder: operator exclusion clauses  $\neg o_i^i \lor \neg o_k^i$ for all 1 < i < T, 1 < i < k < n

- ▶ Ideally: replace with clauses that express "for all states s, the operators selected at time *i* are interference-free in *s*"
- but: testing if a given set of operators interferes in any state is itself an NP-complete problem
- for interference-freeness that can be expressed at the level of pairs of operators

B6. SAT Planning: Parallel Encoding

## **Conflicting Operators**

- Intuitively, two operators conflict if
  - one can disable the precondition of the other.
  - one can override an effect of the other, or
  - one can enable or disable an effect condition of the other.
- ▶ If no two operators in a set O' conflict, then O' is interference-free in all states.
- This is still difficult to test, so we restrict attention to the STRIPS case in the following.

### Definition (Conflicting STRIPS Operator)

Operators o and o' of a STRIPS task  $\Pi$  conflict if

- $\triangleright$  o deletes a precondition of o' or vice versa, or
- o deletes an add effect of o' or vice versa.

M. Helmert, T. Keller (Universität Basel)

B6. SAT Planning: Parallel Encoding

Adapting the SAT Encoding

## Adapting the Operator Exclusion Clauses: Solution

Reminder: operator exclusion clauses  $\neg o_i^i \lor \neg o_k^i$ for all 1 < i < T, 1 < i < k < n

#### Solution:

Parallel SAT Formula: Operator Exclusion Clauses operator exclusion clauses:

such that  $o_i$  and  $o_k$  conflict

B6. SAT Planning: Parallel Encoding

Adapting the SAT Encoding

## Adapting the Frame Clauses: Idea

Reminder: frame clauses

$$(o^i \wedge v^{i-1} \wedge \neg v^i) \rightarrow \delta^{i-1}$$
 for all  $1 \le i \le T$ ,  $o \in O$ ,  $v \in V$   
 $(o^i \wedge \neg v^{i-1} \wedge v^i) \rightarrow \alpha^{i-1}$  for all  $1 \le i \le T$ ,  $o \in O$ ,  $v \in V$ 

### What is the problem?

- These clauses express that if o is applied at time i and the value of v changes, then o caused the change.
- ▶ This is no longer true if we want to be able to apply two operators concurrently.
- $\rightarrow$  Instead, say "If the value of v changes, then some operator must have caused the change."

Adapting the SAT Encoding

## Adapting the Frame Clauses: Solution

Reminder: frame clauses

$$(o^i \wedge v^{i-1} \wedge \neg v^i) \to \delta^{i-1}$$
 for all  $1 \le i \le T$ ,  $o \in O$ ,  $v \in V$   
 $(o^i \wedge \neg v^{i-1} \wedge v^i) \to \alpha^{i-1}$  for all  $1 \le i \le T$ ,  $o \in O$ ,  $v \in V$ 

#### Solution:

Parallel SAT Formula: Frame Clauses positive and negative frame clauses:

$$\triangleright (v^{i-1} \wedge \neg v^i) \rightarrow ((o_1^i \wedge \delta_{o_1}^{i-1}) \vee \cdots \vee (o_n^i \wedge \delta_{o_n}^{i-1}))$$

for all 
$$1 \le i \le T$$
,  $v \in V$ 

$$\qquad \qquad (\neg v^{i-1} \wedge v^i) \rightarrow ((o_1^i \wedge \alpha_{o_1}^{i-1}) \vee \cdots \vee (o_n^i \wedge \alpha_{o_n}^{i-1}))$$

for all 
$$1 \le i \le T$$
,  $v \in V$ 

where 
$$\alpha_o = effcond(v, eff(o))$$
,  $\delta_o = effcond(\neg v, eff(o))$ ,  $O = \{o_1, \dots, o_n\}$ .

For STRIPS, these are in clause form.

B6. SAT Planning: Parallel Encoding

M. Helmert, T. Keller (Universität Basel)

Summar

## Summary

- As a rule of thumb, SAT solvers generally perform better on formulas with fewer variables.
- ► Parallel encodings reduce the number of variables by shortening the horizon needed to solve a planning task.
- ▶ Parallel encodings replace the constraint that operators are not applied concurrently by the constraint that conflicting operators are not applied concurrently.
- ► To make parallelism possible, the frame clauses also need to be adapted.
