

C6. Delete Relaxation: Best Achievers,  $h^{\text{FF}}$  and Comparison

Choice Functions

#### C6. Delete Relaxation: Best Achievers, h<sup>FF</sup> and Comparison

## **Motivation**

- In this chapter, we analyze the behaviour of h<sup>max</sup> and h<sup>add</sup> more deeply.
- Our goal is to understand their shortcomings and use this understanding to devise an improved heuristic.
- As a preparation for our analysis, we need some further definitions that concern choices in AND/OR graphs.
- The key observation is that if we want to establish the value of a certain node n, we can to some extent choose how we want to achieve the OR nodes that are relevant to achieving n.

Choice Functions

Choice Functions

C6. Delete Relaxation: Best Achievers,  $h^{\mathsf{FF}}$  and Comparison

## Choice Functions

Definition (Choice Function)

Let G be an AND/OR graph with nodes N and OR nodes  $N_{OR}$ . A choice function for G is a function  $f : N' \to N$  defined on some set  $N' \subseteq N_{OR}$  such that  $f(n) \in succ(n)$  for all  $n \in N'$ .

- In words, choice functions select (at most) one successor for each OR node of G.
- lntuitively, f(n) selects by which disjunct *n* is achieved.
- If f(n) is undefined for a given n, the intuition is that n is not achieved.

Best Achievers

## Reduced Graphs

Once we have decided how to achieve an OR node, we can remove the other alternatives:

#### Definition (Reduced Graph)

Let G be an AND/OR graph, and let f be a choice function for G defined on nodes N'.

The reduced graph for f is the subgraph of Gwhere all outgoing arcs of OR nodes are removed except for the chosen arcs  $\langle n, f(n) \rangle$  with  $n \in N'$ .

C6. Delete Relaxation: Best Achievers,  $h^{\mathsf{FF}}$  and Comparison

M. Helmert, T. Keller (Universität Basel)

Choice Functions Induced by  $h^{\text{max}}$  and  $h^{\text{add}}$ 

Which choices do  $h^{max}$  and  $h^{add}$  make?

- At every OR node n, we set the cost of n to the minimum of the costs of the successors of n.
- The motivation for this is to achieve n via the successor that can be achieved most cheaply according to our cost estimates.

Planning and Optimization

- → This corresponds to defining a choice function fwith  $f(n) \in \arg \min_{n' \in N'} n'.cost$  for all reached OR nodes n, where  $N' \subseteq succ(n)$  are all successors of n processed before n.
- The successors chosen by this cost function are called best achievers (according to h<sup>max</sup> or h<sup>add</sup>).
- Note that the best achiever function f is in general not well-defined because there can be multiple minimizers. We assume that ties are broken arbitrarily.

Best Achiever

Paths in Best Achiever Graphs

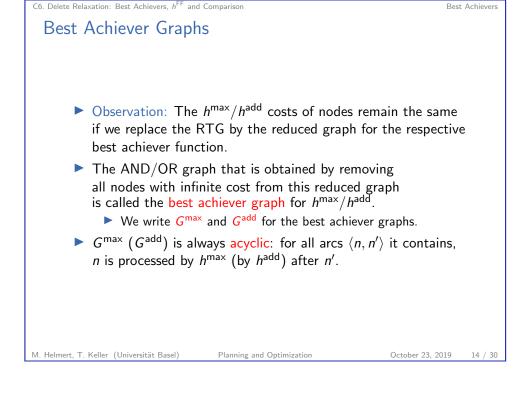

Let n be a node of the best achiever graph.

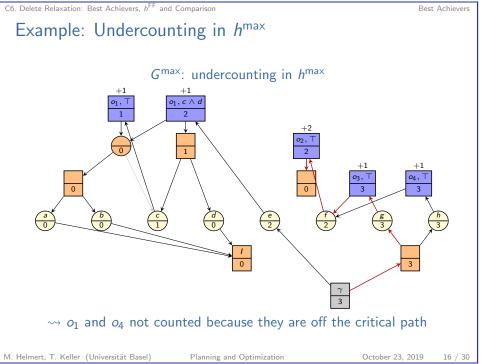

Let  $N_{eff}$  be the set of effect nodes of the best achiever graph. The cost of an effect node is the cost of the associated operator. The cost of a path in the best achiever graph is the sum of costs of all effect nodes on the path.

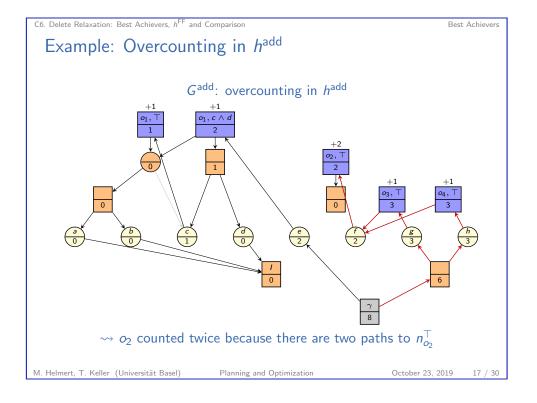

The following properties can be shown by induction:

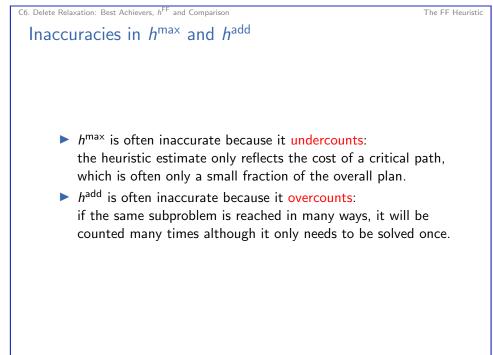

- h<sup>max</sup>(n) is the maximum cost of all paths originating from n in G<sup>max</sup>. A path achieving this maximum is called a critical path.
- h<sup>add</sup>(n) is the sum, over all effect nodes n', of the cost of n' multiplied by the number of paths from n to n' in G<sup>add</sup>.

In particular, these properties hold for the goal node  $n_{\gamma}$  if it is reachable.

The FF Heuristic

## The FF Heuristic

Fortunately, with the perspective of best achiever graphs, there is a simple solution: count all effect nodes that  $h^{\text{add}}$ would count, but only count each of them once.

#### Definition (FF Heuristic)

Let  $\Pi = \langle V, I, O, \gamma \rangle$  be a propositional planning task in positive normal form. The FF heuristic for a state s of  $\Pi$ , written  $h^{FF}(s)$ , is computed as follows:

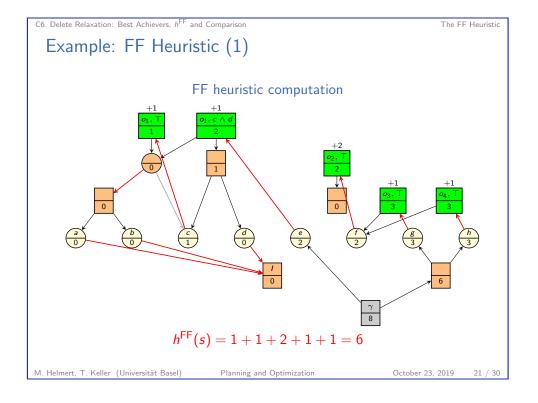

- Construct the RTG for the task  $\langle V, s, O^+, \gamma \rangle$ .
- $\triangleright$  Construct the best achiever graph  $G^{\text{add}}$ .
- Compute the set of effect nodes  $\{n_{o_1}^{\chi_1}, \ldots, n_{o_k}^{\chi_k}\}$ reachable from  $n_{\gamma}$  in  $G^{\text{add}}$ .
- Return  $h^{\mathsf{FF}}(s) = \sum_{i=1}^{k} \operatorname{cost}(o_i)$ .

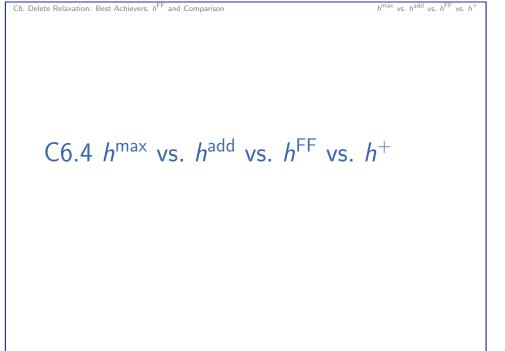

Note:  $h^{FF}$  is not well-defined; different tie-breaking policies for best achievers can lead to different heuristic values

 $h^{\text{max}}$  vs.  $h^{\text{add}}$  vs.  $h^{\text{FF}}$  vs.  $h^{+}$ 

# **Optimal Delete Relaxation Heuristic**

## Definition ( $h^+$ Heuristic)

Let  $\Pi$  be a propositional planning task in positive normal form, and let s be a state of  $\Pi$ .

The optimal delete relaxation heuristic for s, written  $h^+(s)$ , is defined as the perfect heuristic  $h^*(s)$  of state s in the delete-relaxed task  $\Pi^+$ .

- **•** Reminder: We proved that  $h^+(s)$  is hard to compute. (BCPLANEX is NP-complete for delete-relaxed tasks.)
- ▶ The optimal delete relaxation heuristic is often used as a reference point for comparison.

#### C6. Delete Relaxation: Best Achievers, $h^{\rm FF}$ and Comparison

 $h^{\rm max}$  vs.  $h^{\rm add}$  vs.  $h^{\rm FF}$  vs.  $h^+$ 

# Relationships between Delete Relaxation Heuristics (1)

## Theorem

Let  $\Pi$  be a propositional planning task in positive normal form, and let s be a state of  $\Pi$ .

### Then:

- $h^{max}(s) \le h^+(s) \le h^{FF}(s) \le h^{add}(s)$
- $h^{max}(s) = \infty \text{ iff } h^+(s) = \infty \text{ iff } h^{FF}(s) = \infty \text{ iff } h^{add}(s) = \infty$

Planning and Optimization

- **(a)**  $h^{max}$  and  $h^+$  are admissible and consistent.
- h<sup>FF</sup> and h<sup>add</sup> are neither admissible nor consistent.
- S All four heuristics are safe and goal-aware.

h<sup>max</sup> vs. h<sup>add</sup> vs. h<sup>FF</sup> vs. h<sup>+</sup>

C6. Delete Relaxation: Best Achievers,  $h^{\text{FF}}$  and Comparison

Relationships between Delete Relaxation Heuristics (3) Proof Sketch (continued). for 2: all heuristics are infinite iff the task has no relaxed solution for 3: follows from  $h^{\max}(s) \le h^+(s)$ because we already know that  $h^+$  is admissible for 4: construct a counterexample to admissibility for  $h^{\text{FF}}$ for 5: goal-awareness is easy to show; safety follows from 2.+3. C6. Delete Relaxation: Best Achievers,  $h^{\mathsf{FF}}$  and Comparison

#### h<sup>max</sup> vs. h<sup>add</sup> vs. h<sup>FF</sup> vs. h<sup>+</sup>

# Relationships between Delete Relaxation Heuristics (2)

#### Proof Sketch.

#### for 1:

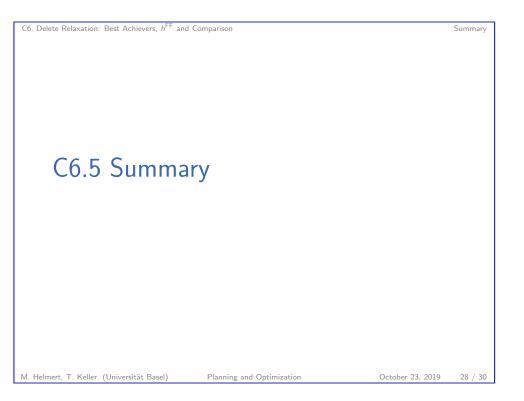

- To show h<sup>max</sup>(s) ≤ h<sup>+</sup>(s), show that critical path costs can be defined for arbitrary relaxed plans and that the critical path cost of a plan is never larger than the cost of the plan. Then show that h<sup>max</sup>(s) computes the minimal critical path cost over all delete-relaxed plans.
- To show h<sup>+</sup>(s) ≤ h<sup>FF</sup>(s), prove that the operators belonging to the effect nodes counted by h<sup>FF</sup> form a relaxed plan.
  No relaxed plan is cheaper than h<sup>+</sup> by definition of h<sup>+</sup>.

Planning and Optimization

- *h*<sup>FF</sup>(s) ≤ *h*<sup>add</sup>(s) is obvious from the description of *h*<sup>FF</sup>: both heuristics count the same operators, but *h*<sup>add</sup> may count some of them multiple times.

. . .

C6. Delete Relaxation: Best Achievers, *h*<sup>FF</sup> and Comparison

## Summary

- h<sup>max</sup> and h<sup>add</sup> can be used to decide how to achieve OR nodes in a relaxed task graph → best achievers
- Best achiever graphs help identify shortcomings of  $h^{max}$  and  $h^{add}$  compared to the perfect delete relaxation heuristic  $h^+$ .
  - h<sup>max</sup> underestimates h<sup>+</sup> because it only considers the cost of a critical path for the relaxed planning task.
  - h<sup>add</sup> overestimates h<sup>+</sup> because it double-counts operators occurring on multiple paths in the best achiever graph.

Planning and Optimization

- The FF heuristic repairs this flaw of h<sup>add</sup> and therefore approximates h<sup>+</sup> more closely.
- ▶ In general,  $h^{\max}(s) \le h^+(s) \le h^{\mathsf{FF}}(s) \le h^{\mathsf{add}}(s)$ .
- $h^{\text{max}}$  and  $h^+$  are admissible;  $h^{\text{FF}}$  and  $h^{\text{add}}$  are not.

Summary

## Literature Pointers

C6. Delete Relaxation: Best Achievers. h<sup>FF</sup> and Comparison

(Some) delete-relaxation heuristics in the planning literature:

- additive heuristic h<sup>add</sup> (Bonet, Loerincs & Geffner, 1997)
- maximum heuristic h<sup>max</sup> (Bonet & Geffner, 1999)
- (original) FF heuristic (Hoffmann & Nebel, 2001)
- cost-sharing heuristic h<sup>cs</sup> (Mirkis & Domshlak, 2007)
- set-additive heuristics h<sup>sa</sup> (Keyder & Geffner, 2008)
- ► FF/additive heuristic *h*<sup>FF</sup> (Keyder & Geffner, 2008)
- ▶ local Steiner tree heuristic *h*<sup>lst</sup> (Keyder & Geffner, 2009)
- $\rightsquigarrow$  also hybrids such as semi-relaxed heuristics and delete-relaxation landmark heuristics
