# B4.1 Tuples and the Cartesian Product

- ► A set is an unordered collection of distinct objects.
- A tuple is an ordered sequence of objects.

#### Tuples

- ▶ *k*-tuple: ordered sequence of *k* objects ( $k \in \mathbb{N}_0$ )
- written  $(o_1, \ldots, o_k)$  or  $\langle o_1, \ldots, o_k \rangle$
- unlike sets, order matters ( $\langle 1,2 \rangle \neq \langle 2,1 \rangle$ )
- objects may occur multiple times in a tuple
- objects contained in tuples are called components
- terminology:
  - $\blacktriangleright$  k = 2: (ordered) pair
  - k = 3: triple
  - more rarely: quadruple, quintuple, sextuple, septuple, ...
- if k is clear from context (or does not matter), often just called tuple

### Equality of Tuples

#### Definition (Equality of Tuples) Two *n*-tuples $t = \langle o_1, \ldots, o_n \rangle$ and $t' = \langle o'_1, \ldots, o'_n \rangle$ are equal (t = t') if for $i \in \{1, \ldots, n\}$ it holds that $o_i = o'_i$ .

#### Cartesian Product

Definition (Cartesian Product and Cartesian Power) Let  $S_1, \ldots, S_n$  be sets. The Cartesian product  $S_1 \times \cdots \times S_n$  is the following set of *n*-tuples:

 $S_1 \times \cdots \times S_n = \{ \langle x_1, \ldots, x_n \rangle \mid x_1 \in S_1, x_2 \in S_2, \ldots, x_n \in S_n \}.$ 

The *k*-ary Cartesian power of a set *S* (with  $k \in \mathbb{N}_1$ ) is the set  $S^k = \{ \langle o_1, \dots, o_k \rangle \mid o_i \in S \text{ for all } i \in \{1, \dots, k\} \} = \underbrace{S \times \dots \times S}_{k \text{ times}}.$ 

René Descartes: French mathematician and philosopher (1596–1650) Example:  $A = \{a, b\}, B = \{1, 2, 3\}$ 

$$A \times B = \{(a, 1), (a, 2), (a, 3), (b, 1), (b, 2), (b, 3)\}$$
$$A^{2} = \{(a, a), (a, b), (b, a), (b, b)\}$$

B4. Tuples & Cartesian Product

## (Non-)properties of the Cartesian Product

#### The Cartesian product is

- not commutative, in most cases  $A \times B \neq B \times A$ .
- not associative, in most cases  $(A \times B) \times C \neq A \times (B \times C)$

Why? Exceptions?
