■ Possible properties of homogeneous relations $R$ over $S$ :

- reflexive: $(x, x) \in R$ for all $x \in S$
- irreflexive: $(x, x) \notin R$ for all $x \in S$
- symmetric: $(x, y) \in R$ iff $(y, x) \in R$

## Relations: Recap

■ A relation over sets $S_{1}, \ldots, S_{n}$ is a set $R \subseteq S_{1} \times \cdots \times S_{n}$.
■ Possible properties of homogeneous relations $R$ over $S$ :

- reflexive: $(x, x) \in R$ for all $x \in S$
- irreflexive: $(x, x) \notin R$ for all $x \in S$
- symmetric: $(x, y) \in R$ iff $(y, x) \in R$
- asymmetric: if $(x, y) \in R$ then $(y, x) \notin R$

## Relations: Recap

■ A relation over sets $S_{1}, \ldots, S_{n}$ is a set $R \subseteq S_{1} \times \cdots \times S_{n}$.
■ Possible properties of homogeneous relations $R$ over $S$ :

- reflexive: $(x, x) \in R$ for all $x \in S$
- irreflexive: $(x, x) \notin R$ for all $x \in S$
- symmetric: $(x, y) \in R$ iff $(y, x) \in R$
- asymmetric: if $(x, y) \in R$ then $(y, x) \notin R$
- antisymmetric: if $(x, y) \in R$ then $(y, x) \notin R$ or $x=y$

## Relations: Recap

■ A relation over sets $S_{1}, \ldots, S_{n}$ is a set $R \subseteq S_{1} \times \cdots \times S_{n}$.
■ Possible properties of homogeneous relations $R$ over $S$ :

- reflexive: $(x, x) \in R$ for all $x \in S$
- irreflexive: $(x, x) \notin R$ for all $x \in S$
- symmetric: $(x, y) \in R$ iff $(y, x) \in R$
- asymmetric: if $(x, y) \in R$ then $(y, x) \notin R$
- antisymmetric: if $(x, y) \in R$ then $(y, x) \notin R$ or $x=y$
- transitive: if $(x, y) \in R$ and $(y, z) \in R$ then $(x, z) \in R$

## Motivation

- Think of any attribute that two objects can have in common, e. g. their color.

■ We could place the objects into distinct "buckets",
e.g. one bucket for each color.

■ We also can define a relation $\sim$ such that $x \sim y$ iff $x$ and $y$ share the attribute, e.g.have the same color.

- Would this relation be

■ reflexive?
■ irreflexive?
■ symmetric?
■ asymmetric?
■ antisymmetric?
■ transitive?

## Equivalence Relation

## Definition (Equivalence Relation)

A binary relation $\sim$ over set $S$ is an equivalence relation if $\sim$ is reflexive, symmetric and transitive.

Is this definition indeed what we want?
Does it allow us to partition the objects into buckets (e.g. one group for all objects that share a specific color)?

## Partition

## Definition (Partition)

A partition of a set $S$ is a set $P \subseteq \mathcal{P}(S)$ such that

- $X \neq \emptyset$ for all $X \in P$,
- $\bigcup_{X \in P} X=S$, and

■ $X \cap Y=\emptyset$ for all $X, Y \in P$ with $X \neq Y$,
The elements of $P$ are called the blocks of the partition.

## Partition

Let $S=\left\{e_{1}, \ldots, e_{5}\right\}$.
Which of the following sets are partitions of $S$ ?
■ $P_{1}=\left\{\left\{e_{1}, e_{4}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$

## Partition

Let $S=\left\{e_{1}, \ldots, e_{5}\right\}$.
Which of the following sets are partitions of $S$ ?
■ $P_{1}=\left\{\left\{e_{1}, e_{4}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$

- $P_{2}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\}\right\}$

## Partition

Let $S=\left\{e_{1}, \ldots, e_{5}\right\}$.
Which of the following sets are partitions of $S$ ?
■ $P_{1}=\left\{\left\{e_{1}, e_{4}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$

- $P_{2}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\}\right\}$

■ $P_{3}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$

## Partition

Let $S=\left\{e_{1}, \ldots, e_{5}\right\}$.
Which of the following sets are partitions of $S$ ?

- $P_{1}=\left\{\left\{e_{1}, e_{4}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$
- $P_{2}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\}\right\}$
- $P_{3}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$
- $P_{4}=\left\{\left\{e_{1}\right\},\left\{e_{2}\right\},\left\{e_{3}\right\},\left\{e_{4}\right\},\left\{e_{5}\right\}\right\}$

## Partition

Let $S=\left\{e_{1}, \ldots, e_{5}\right\}$.
Which of the following sets are partitions of $S$ ?

- $P_{1}=\left\{\left\{e_{1}, e_{4}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$
- $P_{2}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\}\right\}$
- $P_{3}=\left\{\left\{e_{1}, e_{4}, e_{5}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$

■ $P_{4}=\left\{\left\{e_{1}\right\},\left\{e_{2}\right\},\left\{e_{3}\right\},\left\{e_{4}\right\},\left\{e_{5}\right\}\right\}$

- $P_{5}=\left\{\left\{e_{1}\right\},\left\{e_{2}\right\},\left\{e_{3}\right\},\left\{e_{4}\right\},\left\{e_{5}\right\},\{ \}\right\}$

## A Property of Partitions

## Lemma

Let $S$ be a set and $P$ be a partition of $S$.
Then every $x \in S$ is an element of exactly one $X \in P$.

Proof: $\rightsquigarrow$ exercises

## Block of an Element

The lemma enables the following definition:

## Definition

Let $S$ be a set and $P$ be a partition of $S$.
For $e \in S$ we denote by $[e]_{P}$ the block $X \in P$ such that $e \in X$.

## Block of an Element

The lemma enables the following definition:

## Definition

Let $S$ be a set and $P$ be a partition of $S$.
For $e \in S$ we denote by $[e]_{P}$ the block $X \in P$ such that $e \in X$.

Consider partition $P=\left\{\left\{e_{1}, e_{4}\right\},\left\{e_{3}\right\},\left\{e_{2}, e_{5}\right\}\right\}$ of $\left\{e_{1}, \ldots, e_{5}\right\}$.
$\left[e_{1}\right]_{P}=$

## Connection between Partitions and Equivalence Relations?

■ We will now explore the connection between partitions and equivalence relations.

- Spoiler: They are essentially the same concept.

## Partitions Induce Equivalence Relations I

Definition (Relation induced by a partition)
Let $S$ be a set and $P$ be a partition of $S$.
The relation $\sim_{P}$ induced by $P$ is the binary relation over $S$ with

$$
x \sim_{P} y \text { iff }[x]_{P}=[y]_{P}
$$

$x \sim_{p} y$ iff $x$ and $y$ are in the same block of $P$.

## Partitions Induce Equivalence Relations I

## Definition (Relation induced by a partition)

Let $S$ be a set and $P$ be a partition of $S$.
The relation $\sim_{p}$ induced by $P$ is the binary relation over $S$ with

$$
x \sim_{P} y \text { iff }[x]_{P}=[y]_{P}
$$

$x \sim_{p} y$ iff $x$ and $y$ are in the same block of $P$.
Consider partition $P=\{\{1,4,5\},\{2,3\}\}$ of set $\{1,2, \ldots, 5\}$.

$$
\begin{aligned}
\sim_{p}=\{ & (1,1),(1,4),(1,5),(4,1),(4,4),(4,5),(5,1),(5,4),(5,5), \\
& (2,2),(2,3),(3,2),(3,3)\}
\end{aligned}
$$

We will show that $\sim_{p}$ is an equivalence relation.

## Partitions Induce Equivalence Relations II

Theorem
Let $P$ be a partition of $S$.
Relation $\sim_{p}$ induced by $P$ is an equivalence relation over $S$.

## Partitions Induce Equivalence Relations II

Theorem
Let $P$ be a partition of $S$.
Relation $\sim_{p}$ induced by $P$ is an equivalence relation over $S$.

## Proof.

We need to show that $\sim_{p}$ is reflexive, symmetric and transitive.

## Partitions Induce Equivalence Relations II

## Theorem

Let $P$ be a partition of $S$.
Relation $\sim_{p}$ induced by $P$ is an equivalence relation over $S$.

## Proof.

We need to show that $\sim_{p}$ is reflexive, symmetric and transitive. reflexive: As $=$ is reflexive it holds for all $x \in S$ that $[x]_{P}=[x]_{P}$ and hence also that $x \sim_{p} x$.

## Partitions Induce Equivalence Relations II

## Theorem

Let $P$ be a partition of $S$.
Relation $\sim_{p}$ induced by $P$ is an equivalence relation over $S$.

## Proof.

We need to show that $\sim_{p}$ is reflexive, symmetric and transitive. reflexive: As $=$ is reflexive it holds for all $x \in S$ that $[x]_{P}=[x]_{P}$ and hence also that $x \sim_{p} x$.
symmetric: If $x \sim_{P} y$ then $[x]_{P}=[y]_{P}$. With the symmetry of $=$ we get that $[y]_{P}=[x]_{P}$ and conclude that $y \sim_{P} x$.

## Partitions Induce Equivalence Relations II

## Theorem

Let $P$ be a partition of $S$.
Relation $\sim_{p}$ induced by $P$ is an equivalence relation over $S$.

## Proof.

We need to show that $\sim_{p}$ is reflexive, symmetric and transitive. reflexive: As $=$ is reflexive it holds for all $x \in S$ that $[x]_{P}=[x]_{P}$ and hence also that $x \sim_{P} x$.
symmetric: If $x \sim_{P} y$ then $[x]_{P}=[y]_{P}$. With the symmetry of $=$ we get that $[y]_{P}=[x]_{P}$ and conclude that $y \sim_{P} x$.
transitive: If $x \sim_{P} y$ and $y \sim_{P} z$ then $[x]_{P}=[y]_{P}$ and $[y]_{P}=[z]_{P}$. As $=$ is transitive, it then also holds that $[x]_{P}=[z]_{P}$ and hence $x \sim_{P} z$.

## Equivalence Classes

Definition (equivalence class)
Let $R$ be an equivalence relation over set $S$.
For any $x \in S$, the equivalence class of $x$ is the set

$$
[x]_{R}=\{y \in S \mid x R y\}
$$

## Equivalence Classes

## Definition (equivalence class)

Let $R$ be an equivalence relation over set $S$.
For any $x \in S$, the equivalence class of $x$ is the set

$$
[x]_{R}=\{y \in S \mid x R y\} .
$$

Consider

```
R={(1,1),(1,4),(1, 5),(4, 1), (4, 4), (4, 5), (5, 1), (5, 4), (5, 5),
    (2, 2),(2,3),(3,2),(3,3)}
over set \(\{1,2, \ldots, 5\}\).
```

$[4]_{R}=$

## Equivalence Relations Induce Partitions

Theorem
Let $R$ be an equivalence relation over set $S$. The set $P=\left\{[x]_{R} \mid x \in S\right\}$ is a partition of $S$.

## Equivalence Relations Induce Partitions

## Theorem

Let $R$ be an equivalence relation over set $S$.
The set $P=\left\{[x]_{R} \mid x \in S\right\}$ is a partition of $S$.

## Proof.

We need to show that
(1) $X \neq \emptyset$ for all $X \in P$,
(2) $\bigcup_{X \in P} X=S$, and
(3) $X \cap Y=\emptyset$ for all $X, Y \in P$ with $X \neq Y$,

## Equivalence Relations Induce Partitions

## Theorem

Let $R$ be an equivalence relation over set $S$.
The set $P=\left\{[x]_{R} \mid x \in S\right\}$ is a partition of $S$.

## Proof.

We need to show that
(1) $X \neq \emptyset$ for all $X \in P$,
(2) $\bigcup_{X \in P} X=S$, and
(3) $X \cap Y=\emptyset$ for all $X, Y \in P$ with $X \neq Y$,

1) For $x \in S$, it holds that $x \in[x]_{R}$ because $R$ is reflexive. Hence, no $X \in P$ is empty.

## Equivalence Relations Induce Partitions

Proof (continued).
For 2) we show $\bigcup_{X \in P} X \subseteq S$ and $\bigcup_{X \in P} X \supseteq S$ separately.

## Equivalence Relations Induce Partitions

## Proof (continued).

For 2) we show $\bigcup_{X \in P} X \subseteq S$ and $\bigcup_{X \in P} X \supseteq S$ separately.
$\subseteq$ : Consider an arbitrary $x \in \bigcup_{X \in P} X$. Since $x$ is contained in the union, it must be an element of some $X \in P$. Consider such an $X$. By the definition of $P$, there is a $y \in S$ such that $X=[y]_{R}$. Since $x \in[y]_{R}$, it holds that $y R x$.
As $R$ is a relation over $S$, this implies that $x \in S$.

## Equivalence Relations Induce Partitions

## Proof (continued).

For 2) we show $\bigcup_{X \in P} X \subseteq S$ and $\bigcup_{X \in P} X \supseteq S$ separately.
$\subseteq$ : Consider an arbitrary $x \in \bigcup_{X \in P} X$. Since $x$ is contained in the union, it must be an element of some $X \in P$. Consider such an $X$. By the definition of $P$, there is a $y \in S$ such that $X=[y]_{R}$. Since $x \in[y]_{R}$, it holds that $y R x$.
As $R$ is a relation over $S$, this implies that $x \in S$.
〇: Consider an arbitrary $x \in S$. Since $x \in[x]_{R}$ (cf. 1) and $[x]_{R} \in P$, it holds that $x \in \bigcup_{X \in P} X$.

## Equivalence Relations Induce Partitions

## Proof (continued).

We show 3) by contrapositive:
For all $X, Y \in P$ : if $X \cap Y \neq \emptyset$ then $X=Y$.

## Equivalence Relations Induce Partitions

## Proof (continued).

We show 3) by contrapositive:
For all $X, Y \in P$ : if $X \cap Y \neq \emptyset$ then $X=Y$.
Let $X, Y$ be two sets from $P$ with $X \cap Y \neq \emptyset$.
Then there is an $e$ with $e \in X \cap Y$ and there are $x, y \in S$ with $X=[x]_{R}$ and $Y=[y]_{R}$. Consider such $e, x, y$.

## Equivalence Relations Induce Partitions

## Proof (continued).

We show 3) by contrapositive:
For all $X, Y \in P$ : if $X \cap Y \neq \emptyset$ then $X=Y$.
Let $X, Y$ be two sets from $P$ with $X \cap Y \neq \emptyset$.
Then there is an $e$ with $e \in X \cap Y$ and there are $x, y \in S$ with $X=[x]_{R}$ and $Y=[y]_{R}$. Consider such $e, x, y$.
As $e \in[x]_{R}$ and $e \in[y]_{R}$ it holds that $x R e$ and $y R e$. Since $R$ is symmetric, we get from $y R e$ that eRy. By transitivity, $x R e$ and $e R y$ imply $x R y$, which by symmetry also gives $y R x$.

## Equivalence Relations Induce Partitions

## Proof (continued).

We show 3) by contrapositive:
For all $X, Y \in P$ : if $X \cap Y \neq \emptyset$ then $X=Y$.
Let $X, Y$ be two sets from $P$ with $X \cap Y \neq \emptyset$.
Then there is an $e$ with $e \in X \cap Y$ and there are $x, y \in S$ with $X=[x]_{R}$ and $Y=[y]_{R}$. Consider such $e, x, y$.
As $e \in[x]_{R}$ and $e \in[y]_{R}$ it holds that $x R e$ and $y R e$. Since $R$ is symmetric, we get from $y R e$ that eRy. By transitivity, $x R e$ and $e R y$ imply $x R y$, which by symmetry also gives $y R x$.
We show $[x]_{R} \subseteq[y]_{R}$ : consider an arbitrary $z \in[x]_{R}$. Then $x R z$. From $y R x$ and $x R z$, by transitivity we get $y R z$. This establishes $z \in[y]_{R}$. As $z$ was chosen arbitarily, it holds that $[x]_{R} \subseteq[y]_{R}$.

## Equivalence Relations Induce Partitions

## Proof (continued).

We show 3) by contrapositive:
For all $X, Y \in P$ : if $X \cap Y \neq \emptyset$ then $X=Y$.
Let $X, Y$ be two sets from $P$ with $X \cap Y \neq \emptyset$.
Then there is an $e$ with $e \in X \cap Y$ and there are $x, y \in S$ with $X=[x]_{R}$ and $Y=[y]_{R}$. Consider such $e, x, y$.
As $e \in[x]_{R}$ and $e \in[y]_{R}$ it holds that $x R e$ and $y R e$. Since $R$ is symmetric, we get from $y R e$ that $e R y$. By transitivity, $x R e$ and $e R y$ imply $x R y$, which by symmetry also gives $y R x$.
We show $[x]_{R} \subseteq[y]_{R}$ : consider an arbitrary $z \in[x]_{R}$. Then $x R z$. From $y R x$ and $x R z$, by transitivity we get $y R z$. This establishes $z \in[y]_{R}$. As $z$ was chosen arbitarily, it holds that $[x]_{R} \subseteq[y]_{R}$. Analogously, we can show that $[x]_{R} \supseteq[y]_{R}$, so overall $X=Y$.

## Summary

- We typically encounter equivalence relations when we consider objects as equivalent wrt. some attribute/property.
- A relation is an equivalence relation if it is reflexive, symmetric and transitive.
- A partition of a set groups the elements into non-empty subsets.
■ The concepts are closely connected: in principle just different perspectives on the same "situation".

# Discrete Mathematics in Computer Science Partial Orders

## Order Relations

■ An equivalence relation is reflexive, symmetric and transitive.
■ Such a relation induces a partition into "equivalent" objects.

## Order Relations

■ An equivalence relation is reflexive, symmetric and transitive.
■ Such a relation induces a partition into "equivalent" objects.
■ We now consider other combinations of properties, that allow us to compare objects in a set against other objects.

## Order Relations

- An equivalence relation is reflexive, symmetric and transitive.

■ Such a relation induces a partition into "equivalent" objects.
■ We now consider other combinations of properties, that allow us to compare objects in a set against other objects.

- "Number $x$ is not larger than number $y$."
"Set $S$ is a subset of set $T$."
"Jerry runs at least as fast as Tom."
"Pasta tastes better than Potatoes."

## Partial Orders

- We begin with partial orders.

## Partial Orders

- We begin with partial orders.
- Example partial order relations are $\leq$ over $\mathbb{N}$ or $\subseteq$ for sets.

## Partial Orders

- We begin with partial orders.
- Example partial order relations are $\leq$ over $\mathbb{N}$ or $\subseteq$ for sets.
- Are these relations
- reflexive?
- irreflexive?
- symmetric?
- asymmetric?
- antisymmetric?
- transitive?

## Partial Orders - Definition

Definition (Partial order, partially ordered sets)
A binary relation $\preceq$ over set $S$ is a partial order if $\preceq$ is reflexive, antisymmetric and transitive.

## Partial Orders - Definition

## Definition (Partial order, partially ordered sets)

A binary relation $\preceq$ over set $S$ is a partial order if $\preceq$ is reflexive, antisymmetric and transitive.

A partially ordered set (or poset) is a pair $(S, R)$ where $S$ is a set and $R$ is a partial order over $S$.

## Partial Orders - Definition

## Definition (Partial order, partially ordered sets)

A binary relation $\preceq$ over set $S$ is a partial order if $\preceq$ is reflexive, antisymmetric and transitive.
A partially ordered set (or poset) is a pair $(S, R)$ where $S$ is a set and $R$ is a partial order over $S$.

Which of these relations are partial orders?

- strict subset relation $\subset$ for sets
- not-less-than relation $\geq$ over $\mathbb{N}_{0}$
$\square R=\{(a, a),(a, b),(b, b),(b, c),(c, c)\}$ over $\{a, b, c\}$

## Least and Greatest Element

Some special elements of posets:
Definition (Least and greatest element)
Let $\preceq$ be a partial order over set $S$.
An element $x \in S$ is the least element of $S$
if for all $y \in S$ it holds that $x \preceq y$.
It is the greatest element of $S$ if for all $y \in S, y \preceq x$.

## Least and Greatest Element

Some special elements of posets:
Definition (Least and greatest element)
Let $\preceq$ be a partial order over set $S$.
An element $x \in S$ is the least element of $S$
if for all $y \in S$ it holds that $x \preceq y$.
It is the greatest element of $S$ if for all $y \in S, y \preceq x$.

- Is there a least/greatest element? Which one?
- $S=\{1,2,3\}$ and $\preceq=\{(x, y) \mid x, y \in S$ and $x \leq y\}$.

## Least and Greatest Element

Some special elements of posets:
Definition (Least and greatest element)
Let $\preceq$ be a partial order over set $S$.
An element $x \in S$ is the least element of $S$
if for all $y \in S$ it holds that $x \preceq y$.
It is the greatest element of $S$ if for all $y \in S, y \preceq x$.

- Is there a least/greatest element? Which one?

■ $S=\{1,2,3\}$ and $\preceq=\{(x, y) \mid x, y \in S$ and $x \leq y\}$.

- $\mathbb{N}_{0}$ and standard relation $\leq$.

## Least and Greatest Element

Some special elements of posets:

## Definition (Least and greatest element)

Let $\preceq$ be a partial order over set $S$.
An element $x \in S$ is the least element of $S$
if for all $y \in S$ it holds that $x \preceq y$.
It is the greatest element of $S$ if for all $y \in S, y \preceq x$.

- Is there a least/greatest element? Which one?

■ $S=\{1,2,3\}$ and $\preceq=\{(x, y) \mid x, y \in S$ and $x \leq y\}$.

- $\mathbb{N}_{0}$ and standard relation $\leq$.

■ Why can we say the least element instead of a least element?

## Uniqueness of Least Element

## Theorem <br> Let $\preceq$ be a partial order over set $S$. <br> If $S$ contains a least element, it contains exactly one least element.

## Uniqueness of Least Element

## Theorem

Let $\preceq$ be a partial order over set $S$.
If $S$ contains a least element, it contains exactly one least element.

## Proof.

By contradiction: Assume $x, y$ are least elements of $S$ with $x \neq y$.

## Uniqueness of Least Element

## Theorem

Let $\preceq$ be a partial order over set $S$.
If $S$ contains a least element, it contains exactly one least element.

## Proof.

By contradiction: Assume $x, y$ are least elements of $S$ with $x \neq y$. Since $x$ is a least element, $x \preceq y$ is true.
Since $y$ is a least element, $y \preceq x$ is true.

## Uniqueness of Least Element

## Theorem

Let $\preceq$ be a partial order over set $S$.
If $S$ contains a least element, it contains exactly one least element.

## Proof.

By contradiction: Assume $x, y$ are least elements of $S$ with $x \neq y$. Since $x$ is a least element, $x \preceq y$ is true.
Since $y$ is a least element, $y \preceq x$ is true.
As a partial order is antisymmetric, this implies that $x=y$. $\&$

## Uniqueness of Least Element

## Theorem

Let $\preceq$ be a partial order over set $S$.
If $S$ contains a least element, it contains exactly one least element.

## Proof.

By contradiction: Assume $x, y$ are least elements of $S$ with $x \neq y$. Since $x$ is a least element, $x \preceq y$ is true.
Since $y$ is a least element, $y \preceq x$ is true.
As a partial order is antisymmetric, this implies that $x=y$. $z$

Analogously: If there is a greatest element then is unique.

## Minimal and Maximal Elements

Definition (Minimal/Maximal element of a set)
Let $\preceq$ be a partial order over set $S$.
An element $x \in S$ is a minimal element of $S$
if there is no $y \in S$ with $y \preceq x$ and $x \neq y$.
An element $x \in S$ is a maximal element of $S$
if there is no $y \in S$ with $x \preceq y$ and $x \neq y$.

## Minimal and Maximal Elements

## Definition (Minimal/Maximal element of a set)

Let $\preceq$ be a partial order over set $S$.
An element $x \in S$ is a minimal element of $S$
if there is no $y \in S$ with $y \preceq x$ and $x \neq y$.
An element $x \in S$ is a maximal element of $S$
if there is no $y \in S$ with $x \preceq y$ and $x \neq y$.
A set can have several minimal elements and no least element. Example?

## Total Orders

■ Relations $\leq$ over $\mathbb{N}_{0}$ and $\subseteq$ for sets are partial orders.

## Total Orders

■ Relations $\leq$ over $\mathbb{N}_{0}$ and $\subseteq$ for sets are partial orders.
■ Can we compare every object against every object?

## Total Orders

■ Relations $\leq$ over $\mathbb{N}_{0}$ and $\subseteq$ for sets are partial orders.
■ Can we compare every object against every object?
■ For all $x, y \in \mathbb{N}_{0}$ it holds that $x \leq y$ or that $y \leq x$ (or both).

## Total Orders

■ Relations $\leq$ over $\mathbb{N}_{0}$ and $\subseteq$ for sets are partial orders.
■ Can we compare every object against every object?

- For all $x, y \in \mathbb{N}_{0}$ it holds that $x \leq y$ or that $y \leq x$ (or both).
- $\{1,2\} \nsubseteq\{2,3\}$ and $\{2,3\} \nsubseteq\{1,2\}$

## Total Orders

■ Relations $\leq$ over $\mathbb{N}_{0}$ and $\subseteq$ for sets are partial orders.
■ Can we compare every object against every object?

- For all $x, y \in \mathbb{N}_{0}$ it holds that $x \leq y$ or that $y \leq x$ (or both).
- $\{1,2\} \nsubseteq\{2,3\}$ and $\{2,3\} \nsubseteq\{1,2\}$
- Relation $\leq$ is a total order, relation $\subseteq$ is not.

## Total Order - Definition

## Definition (Total relation)

A binary relation $R$ over set $S$ is total (or connex) if for all $x, y \in S$ at least one of $x R y$ or $y R x$ is true.

## Total Order - Definition

## Definition (Total relation)

A binary relation $R$ over set $S$ is total (or connex)
if for all $x, y \in S$ at least one of $x R y$ or $y R x$ is true.

## Definition (Total order)

A binary relation is a total order if it is total and a partial order.

## Summary

■ A partial order is reflexive, antisymmetric and transitive.

- With a total order $\preceq$ over $S$ there are no elements $x, y \in S$ with $x \npreceq y$ and $y \npreceq x$.
- If $x$ is the greatest element of a set $S$, it is greater than every element: for all $y \in S$ it holds that $y \preceq x$.
- If $x$ is a maximal element of set $S$ then it is not smaller than any other element $y$ : there is no $y \in S$ with $x \preceq y$ and $x \neq y$.

# Discrete Mathematics in Computer Science Strict Orders 

Malte Helmert, Gabriele Röger

University of Basel

## Strict Orders

■ A partial order is reflexive, antisymmetric and transitive.

- We now consider strict orders.

## Strict Orders

- A partial order is reflexive, antisymmetric and transitive.
- We now consider strict orders.

■ Example strict order relations are $<$ over $\mathbb{N}$ or $\subset$ for sets.

## Strict Orders

■ A partial order is reflexive, antisymmetric and transitive.

- We now consider strict orders.

■ Example strict order relations are $<$ over $\mathbb{N}$ or $\subset$ for sets.

- Are these relations
- reflexive?
- irreflexive?
- symmetric?
- asymmetric?
- antisymmetric?
- transitive?

## Strict Orders - Definition

## Definition (Strict order)

A binary relation $\prec$ over set $S$ is a strict order if $\prec$ is irreflexive, asymmetric and transitive.

## Strict Orders - Definition

## Definition (Strict order)

A binary relation $\prec$ over set $S$ is a strict order if $\prec$ is irreflexive, asymmetric and transitive.

Which of these relations are strict orders?
■ subset relation $\subseteq$ for sets

- strict superset relation $\supset$ for sets

## Strict Orders - Definition

## Definition (Strict order) <br> A binary relation $\prec$ over set $S$ is a strict order if $\prec$ is irreflexive, asymmetric and transitive.

Which of these relations are strict orders?
■ subset relation $\subseteq$ for sets

- strict superset relation $\supset$ for sets

Can a relation be both, a partial order and a strict order?

## Strict Total Orders

■ As partial orders, a strict order does not automatically allow us to rank arbitrary two objects against each other.

## Strict Total Orders

- As partial orders, a strict order does not automatically allow us to rank arbitrary two objects against each other.
■ Example 1 (personal preferences):
- "Pasta tastes better than potato."
- "Rice tastes better than bread."
- "Bread tastes better than potato."
- "Rice tastes better than potato."

- This definition of "tastes better than" is a strict order.
- No ranking of pasta against rice or of pasta against bread.

## Strict Total Orders

- As partial orders, a strict order does not automatically allow us to rank arbitrary two objects against each other.
- Example 1 (personal preferences):
- "Pasta tastes better than potato."
- "Rice tastes better than bread."
- "Bread tastes better than potato."
- "Rice tastes better than potato."

- This definition of "tastes better than" is a strict order.
- No ranking of pasta against rice or of pasta against bread.

■ Example 2: $\subset$ relation for sets

## Strict Total Orders

- As partial orders, a strict order does not automatically allow us to rank arbitrary two objects against each other.
- Example 1 (personal preferences):
- "Pasta tastes better than potato."
- "Rice tastes better than bread."
- "Bread tastes better than potato."
- "Rice tastes better than potato."

- This definition of "tastes better than" is a strict order.
- No ranking of pasta against rice or of pasta against bread.
- Example 2: $\subset$ relation for sets
- It doesn't work to simply require that the strict order is total. Why?

## Strict Total Orders - Definition

## Definition (Trichotomy)

A binary relation $R$ over set $S$ is trichotomous if for all $x, y \in S$ exactly one of $x R y, y R x$ or $x=y$ is true.

## Strict Total Orders - Definition

## Definition (Trichotomy)

A binary relation $R$ over set $S$ is trichotomous if for all $x, y \in S$ exactly one of $x R y, y R x$ or $x=y$ is true.

## Definition (Strict total order)

A binary relation $\prec$ over $S$ is a strict total order if $\prec$ is trichotomous and a strict order.

## Strict Total Orders - Definition

## Definition (Trichotomy)

A binary relation $R$ over set $S$ is trichotomous if for all $x, y \in S$ exactly one of $x R y, y R x$ or $x=y$ is true.

## Definition (Strict total order)

A binary relation $\prec$ over $S$ is a strict total order if $\prec$ is trichotomous and a strict order.

A strict total order completely ranks the elements of set $S$.
Example: < relation over $\mathbb{N}_{0}$ gives the standard ordering $0,1,2,3, \ldots$ of natural numbers.

## Special Elements

Special elements are defined almost as for partial orders:
Definition (Least/greatest/minimal/maximal element of a set)
Let $\prec$ be a strict order over set $S$.
An element $x \in S$ is the least element of $S$
if for all $y \in S$ where $y \neq x$ it holds that $x \prec y$.
It is the greatest element of $S$ if for all $y \in S$ where $y \neq x, y \prec x$.
Element $x \in S$ is a minimal element of $S$
if there is no $y \in S$ with $y \prec x$.
It is a maximal element of $S$
if there is no $y \in S$ with $x \prec y$.

## Special Elements - Example

Consider again the previous example:
$S=\{$ Pasta, Potato, Bread, Rice $\}$
$\prec=\{($ Pasta, Potato), (Bread, Potato), (Rice, Potato), (Rice, Bread) $\}$

Is there a least and a greatest element?
Which elements are maximal or minimal?

## Summary and Outlook

■ A strict order is irreflexive, asymmetric and transitive.
■ Strict total orders and special elements are analogously defined as for partial sets but with a special treatment of equal elements.
■ For partial order $\preceq$ we can define a related strict order $\prec$ as $x \prec y$ if $x \preceq y$ and $y \npreceq x$.
■ For strict order $\prec$ we can define a related partial order $\preceq$ as $x \preceq y$ if $x \prec y$ or $x=y$.
■ There are more related concepts, e. g.
■ (total) preorder: (connex), reflexive, transitive

- well-order: total order over $S$ such that every non-empty subset has a least element
