- C1. Introduction to Graphs

## C1.1 Graphs and Directed Graphs

## C1.2 Induced Graphs and Degree Lemma

## C1.1 Graphs and Directed Graphs

## Graphs

Graphs (of various kinds) are ubiquitous in Computer Science and its applications.

Some examples:

- Boolean circuits in hardware design
- control flow graphs in compilers
- pathfinding in video games
- computer networks
- neural networks
- social networks

## Graph Theory

- Graph theory was founded in 1736 by Leonhard Euler's study of the Seven Bridges of Königsberg problem.
- It remains one of the main areas of discrete mathematics to this day.

More on Euler and the Seven Bridges of Königsberg:

- The Seven Bridges of Königsberg - Numberphile. https://youtu.be/W18FDEA1jRQ

## Graphs and Directed Graphs - Definitions

Definition (Graph)
A graph (also: undirected graph) is a pair $G=(V, E)$, where

- $V$ is a finite set called the set of vertices, and
- $E \subseteq\{\{u, v\} \subseteq V \mid u \neq v\}$ is called the set of edges.

German: Graph, ungerichteter Graph, Knoten, Kanten

Definition (Directed Graph)
A directed graph (also: digraph) is a pair $G=(N, A)$, where

- $N$ is a finite set called the set of nodes, and
- $A \subseteq N \times N$ is called the set of arcs.

German: gerichteter Graph, Digraph, Knoten, Kanten/Pfeile

## Graphs and Directed Graphs - Pictorially

often described pictorially:

graph $(V, E)$

directed graph $(N, A)$

- $V=\{\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}, \mathrm{F}, \mathrm{G}\}$
- $N=\{1,2,3,4,5\}$
- $E=\{\{\mathrm{A}, \mathrm{B}\},\{\mathrm{A}, \mathrm{C}\},\{\mathrm{B}, \mathrm{C}\}$,
$\{C, E\},\{D, F\}\}$
- $A=\{(1,2),(1,3),(2,1),(3,5)$,
$(4,3),(4,4),(5,3),(5,4)\}$

## Relationship to Relations

graphs vs. directed graphs:

- edges are sets of two elements, arcs are pairs
- arcs can be self-loops ( $v, v$ ); edges cannot (why not?)
(di-)graphs vs. relations:
- A directed graph $(N, A)$ is essentially identical to ( $=$ contains the same information as) an arbitrary relation $R_{A}$ over the finite set $N$ : $u R_{A} v$ iff $(u, v) \in A$
- A graph $(V, E)$ is essentially identical to an irreflexive symmetric relation $R_{E}$ over the finite set $V$ : $u R_{E} v$ iff $\{u, v\} \in E$

## Other Kinds of Graphs

many variations exist, for example:

- self-loops may be allowed in edges ("non-simple" graphs)
- labeled graphs: additional information associated with vertices and/or edges
- weighted graphs: numbers associated with edges
- multigraphs: multiple edges between same vertices allowed
- mixed graphs: both edges and arcs allowed
- hypergraphs: edges can involve more than 2 vertices
- infinite graphs: may have infinitely many vertices/edges

## Graph Terminology

## Definition (Graph Terminology)

Let $(V, E)$ be a graph.

- $u$ and $v$ are the endpoints of the edge $\{u, v\} \in E$
- $u$ and $v$ are incident to the edge $\{u, v\} \in E$
- $u$ and $v$ are adjacent if $\{u, v\} \in E$
- the vertices adjacent with $v \in V$ are its neighbours neigh $(v)$ : neigh $(v)=\{w \in V \mid\{v, w\} \in E\}$
- the number of neighbours of $v \in V$ is its degree $\operatorname{deg}(v)$ : $\operatorname{deg}(v)=|n \operatorname{eigh}(v)|$

German: Endknoten, inzident, adjazent/benachbart, Nachbarn, Grad

## Graph Terminology - Examples

endpoints, incident, adjacent, neighbours, degree

## Directed Graph Terminology

## Definition (Directed Graph Terminology)

Let $(N, A)$ be a directed graph.

- $u$ is the tail and $v$ is the head of the arc $(u, v) \in A$; we say $(u, v)$ is an arc from $u$ to $v$
- $u$ and $v$ are incident to the $\operatorname{arc}(u, v) \in A$
- $u$ is a predecessor of $v$ and $v$ is a successor of $u$ if $(u, v) \in A$
- the predecessors and successor of $v$ are written as
$\operatorname{pred}(v)=\{u \in N \mid(u, v) \in A\}$ and
$\operatorname{succ}(v)=\{w \in N \mid(v, w) \in A\}$
- the number of predecessors/successors of $v \in N$ is its indegree/outdegree: indeg $(v)=|\operatorname{pred}(v)|$, outdeg $(v)=|\operatorname{succ}(v)|$

German: Fuss, Kopf, inzident, Vorgänger, Nachfolger, Eingangs-/Ausgangsgrad

## Directed Graph Terminology - Examples

head, tail, predecessors, successors, indegree, outdegree

## C1.2 Induced Graphs and Degree Lemma

## Induced Graph of a Directed Graph

Definition (undirected graph induced by a directed graph)
Let $G=(N, A)$ be a directed graph.
The (undirected) graph induced by $G$ is the graph $(N, E)$ with $E=\{\{u, v\} \mid(u, v) \in A, u \neq v\}$.

German: induziert
Questions:

- Why require $u \neq v$ ?
- If $|N|=n$ and $|A|=m$, how many vertices and edges does the induced graph have?
- How does the answer change if $G$ has no self-loops?

## Induced Graph of a Directed Graph - Example

- $N=\{1,2,3,4,5\}$
- $A=\{(1,2),(1,3),(2,1),(3,5)$,
$(4,3),(4,4),(5,3),(5,4)\}$

- $V=\{1,2,3,4,5\}$
- $E=\{\{1,2\},\{1,3\},\{3,4\}$,
$\{3,5\},\{4,5\}\}$

## Degree Lemma

Lemma (degree lemma for directed graphs)
Let $(N, A)$ be a directed graph.
Then $\sum_{v \in N} \operatorname{indeg}(v)=\sum_{v \in N}$ outdeg $(v)=|A|$.
Intuitively: every arc contributes 1 to the indegree of one node and 1 to the outdegree of one node.

Lemma (degree lemma for undirected graphs)
Let $(V, E)$ be a graph.
Then $\sum_{v \in V} \operatorname{deg}(v)=2|E|$.
Intuitively: every edge contributes 1 to the degree of two vertices.

## Corollary

Every graph has an even number of vertices with odd degree.

## Degree Lemma - Example

$$
\begin{aligned}
& \sum_{v \in V} \operatorname{deg}(v) \\
= & \operatorname{deg}(\mathrm{A})+\operatorname{deg}(\mathrm{B})+\operatorname{deg}(\mathrm{C})+\operatorname{deg}(\mathrm{D})+\operatorname{deg}(\mathrm{E})+\operatorname{deg}(\mathrm{F})+\operatorname{deg}(\mathrm{G}) \\
= & 2+2+3+1+1+1+0 \\
= & 10=2 \cdot 5=2 \mid E
\end{aligned}
$$

4 vertices with odd degree

## Degree Lemma - Proof (1)

Proof of degree lemma for directed graphs.

$$
\begin{aligned}
\sum_{v \in N} \operatorname{indeg}(v) & =\sum_{v \in N}|\operatorname{pred}(v)| \\
& =\sum_{v \in N}|\{u \mid u \in N,(u, v) \in A\}| \\
& =\sum_{v \in N}|\{(u, v) \mid u \in N,(u, v) \in A\}| \\
& =\left|\bigcup_{v \in N}\{(u, v) \mid u \in N,(u, v) \in A\}\right| \\
& =|\{(u, v) \mid u \in N, v \in N,(u, v) \in A\}| \\
& =|A|
\end{aligned}
$$

$\sum_{v \in N} \operatorname{outdeg}(v)=|A|$ is analogous.

## Degree Lemma - Proof (2)

We omit the proof for undirected graphs, which can be conducted similarly.
One possible proof strategy that reuses the result we proved:

- Define directed graph $(V, A)$ from the graph $(V, E)$ by orienting each edge into an arc arbitrarily.
- Observe $\operatorname{deg}(v)=\operatorname{indeg}(v)+\operatorname{outdeg}(v)$, where deg refers to the graph and indeg/outdeg to the directed graph.
- Use the degree lemma for directed graphs:
$\sum_{v \in V} \operatorname{deg}(v)=\sum_{v \in V}(\operatorname{indeg}(v)+$ outdeg $(v))=$
$\sum_{v \in V} \operatorname{indeg}(v)+\sum_{v \in V} \operatorname{outdeg}(v)=|A|+|A|=2|A|=2|E|$
