- E4. Inference

## E4.1 Inference Rules and Calculi

## E4.2 Resolution Calculus

## E4.1 Inference Rules and Calculi

## Inference: Motivation

- up to now: proof of logical consequence with semantic arguments
- no general algorithm
- solution: produce formulas that are logical consequences of given formulas with syntactic inference rules
- advantage: mechanical method that can easily be implemented as an algorithm

## Inference Rules

- Inference rules have the form

$$
\frac{\varphi_{1}, \ldots, \varphi_{k}}{\psi}
$$

- Meaning: "Every model of $\varphi_{1}, \ldots, \varphi_{k}$ is a model of $\psi$."
- An axiom is an inference rule with $k=0$.
- A set of inference rules is called a calculus or proof system.

German: Inferenzregel, Axiom, (der) Kalkül, Beweissystem

## Some Inference Rules for Propositional Logic

Modus ponens $\frac{\varphi,(\varphi \rightarrow \psi)}{\psi}$
Modus tollens $\frac{\neg \psi,(\varphi \rightarrow \psi)}{\neg \varphi}$
$\wedge$-elimination $\quad \frac{(\varphi \wedge \psi)}{\varphi} \quad \frac{(\varphi \wedge \psi)}{\psi}$
$\wedge$-introduction $\frac{\varphi, \psi}{(\varphi \wedge \psi)}$
V-introduction $\frac{\varphi}{(\varphi \vee \psi)}$
$\leftrightarrow$-elimination $\quad \frac{(\varphi \leftrightarrow \psi)}{(\varphi \rightarrow \psi)} \quad \frac{(\varphi \leftrightarrow \psi)}{(\psi \rightarrow \varphi)}$

## Derivation

## Definition (Derivation)

A derivation or proof of a formula $\varphi$ from a knowledge base KB is a sequence of formulas $\psi_{1}, \ldots, \psi_{k}$ with

- $\psi_{k}=\varphi$ and
- for all $i \in\{1, \ldots, k\}$ :
- $\psi_{i} \in \mathrm{~KB}$, or
- $\psi_{i}$ is the result of the application of an inference rule to elements from $\left\{\psi_{1}, \ldots, \psi_{i-1}\right\}$.

German: Ableitung, Beweis

## Derivation: Example

## Example

Given: $\mathrm{KB}=\{P,(P \rightarrow Q),(P \rightarrow R),((Q \wedge R) \rightarrow S)\}$
Task: Find derivation of $(S \wedge R)$ from KB .

- $P(\mathrm{~KB})$
© $(P \rightarrow Q)(\mathrm{KB})$
- $Q(1,2$, Modus ponens $)$
- $(P \rightarrow R)(\mathrm{KB})$
- $R(1,4$, Modus ponens $)$
- $(Q \wedge R)(3,5, \wedge$-introduction)
- $((Q \wedge R) \rightarrow S)(K B)$
- $S(6,7$, Modus ponens)
- $(S \wedge R)(8,5, \wedge$-introduction)

## Correctness and Completeness

Definition (Correctness and Completeness of a Calculus)
We write $\mathrm{KB} \vdash_{c} \varphi$ if there is a derivation of $\varphi$ from KB
in calculus $C$.
(If calculus $C$ is clear from context, also only $\mathrm{KB} \vdash \varphi$.)
A calculus $C$ is correct if for all KB and $\varphi$ $\mathrm{KB} \vdash c \varphi$ implies $\mathrm{KB} \models \varphi$.

A calculus $C$ is complete if for all KB and $\varphi$ $\mathrm{KB} \vDash \varphi$ implies $\mathrm{KB} \vdash \subset \varphi$.

Consider calculus $C$, consisting of the derivation rules seen earlier. Question: Is $C$ correct?
Question: Is Complete?
German: korrekt, vollständig

## Refutation-completeness

- We obviously want correct calculi.
- Do we always need a complete calculus?
- Contradiction theorem: $\mathrm{KB} \cup\{\varphi\}$ is unsatisfiable iff $\mathrm{KB} \models \neg \varphi$
- This implies that $\mathrm{KB} \models \varphi$ iff $\mathrm{KB} \cup\{\neg \varphi\}$ is unsatisfiable.
- We can reduce the general implication problem to a test of unsatisfiability.
- In calculi, we use the special symbol $\square$ for (provably) unsatisfiable formulas.

## Definition (Refutation-Completeness)

A calculus $C$ is refutation-complete if $\mathrm{KB} \vdash c \square$ for all unsatisfiable KB.

German: widerlegungsvollständig

## E4.2 Resolution Calculus

## Resolution: Idea

- Resolution is a refutation-complete calculus for knowledge bases in conjunctive normal form.
- Every knowledge base can be transformed into equivalent formulas in CNF.
- Transformation can require exponential time.
- Alternative: efficient transformation into equisatisfiable formulas (not part of this course)
- Show $\mathrm{KB} \models \varphi$ by deriving $\mathrm{KB} \cup\{\neg \varphi\} \vdash_{R} \square$ with resolution calculus $R$.
- Resolution can require exponential time.
- This is probably the case for all refutation-complete proof methods. $\rightsquigarrow$ complexity theory
German: Resolution, erfüllbarkeitsäquivalent

## Knowledge Base as Set of Clauses

Simplified notation of knowledge bases in CNF

- Formula in CNF as set of clauses (due to commutativity, idempotence, associativity of $\wedge$ )
- Set of formulas as set of clauses
- Clause as set of literals (due to commutativity, idempotence, associativity of $\vee$ )
- Knowledge base as set of sets of literals

## Example

$$
\begin{aligned}
\mathrm{KB}=\{ & (P \vee P),((\neg P \vee Q) \wedge(\neg P \vee R) \wedge(Q \vee \neg P) \wedge R), \\
& ((\neg Q \vee \neg R \vee S) \wedge P)\}
\end{aligned}
$$

as set of clauses:
$\Delta=\{\{P\},\{\neg P, Q\},\{\neg P, R\},\{R\},\{\neg Q, \neg R, S\}\}$

## Resolution Rule

The resolution calculus consists of a single rule, called resolution rule:

$$
\frac{C_{1} \cup\{X\}, C_{2} \cup\{\neg X\}}{C_{1} \cup C_{2}}
$$

where $C_{1}$ and $C_{2}$ are (possibly empty) clauses and $X$ is an atomic proposition.
If we derive the empty clause, we write $\square$ instead of $\}$.
Terminology:

- $X$ and $\neg X$ are the resolution literals,
- $C_{1} \cup\{X\}$ and $C_{2} \cup\{\neg X\}$ are the parent clauses, and
- $C_{1} \cup C_{2}$ is the resolvent.

German: Resolutionskalkül, Resolutionsregel, Resolutionsliterale, Elternklauseln, Resolvent

## Proof by Resolution

## Definition (Proof by Resolution)

A proof by resolution of a clause $D$ from a knowledge base $\Delta$ is a sequence of clauses $C_{1}, \ldots, C_{n}$ with

- $C_{n}=D$ and
- for all $i \in\{1, \ldots, n\}$ :
- $C_{i} \in \Delta$, or
- $C_{i}$ is resolvent of two clauses from $\left\{C_{1}, \ldots, C_{i-1}\right\}$.

If there is a proof of $D$ by resolution from $\Delta$, we say that
$D$ can be derived with resolution from $\Delta$ and write $\Delta \vdash_{R} D$.
Remark: Resolution is a correct, refutation-complete, but incomplete calculus.

German: Resolutionsbeweis, mit Resolution aus $\Delta$ abgeleitet

## Proof by Resolution: Example

Proof by Resolution for Testing a Logical Consequence: Example Given: $\mathrm{KB}=\{P,(P \rightarrow(Q \wedge R))\}$.
Show with resolution that $\mathrm{KB} \vDash(R \vee S)$.
Three steps:
(1) Reduce logical consequence to unsatisfiability.
(2) Transform knowledge base into clause form (CNF).
(3) Derive empty clause $\square$ with resolution.

Step 1: Reduce logical consequence to unsatisfiability. $\mathrm{KB} \vDash(R \vee S)$ iff $\mathrm{KB} \cup\{\neg(R \vee S)\}$ is unsatisfiable.
Thus, consider
$\mathrm{KB}^{\prime}=\mathrm{KB} \cup\{\neg(R \vee S)\}=\{P,(P \rightarrow(Q \wedge R)), \neg(R \vee S)\}$.

## Proof by Resolution: Example (continued)

Proof by Resolution for Testing a Logical Consequence: Example $\mathrm{KB}^{\prime}=\{P,(P \rightarrow(Q \wedge R)), \neg(R \vee S)\}$.
Step 2: Transform knowledge base into clause form (CNF).

- $P$
$\rightsquigarrow$ Clauses: $\{P\}$
- $P \rightarrow(Q \wedge R)) \equiv(\neg P \vee(Q \wedge R)) \equiv((\neg P \vee Q) \wedge(\neg P \vee R))$
$\rightsquigarrow$ Clauses: $\{\neg P, Q\},\{\neg P, R\}$
- $\neg(R \vee S) \equiv(\neg R \wedge \neg S)$
$\rightsquigarrow$ Clauses: $\{\neg R\},\{\neg S\}$
$\Delta=\{\{P\},\{\neg P, Q\},\{\neg P, R\},\{\neg R\},\{\neg S\}\}$

## Proof by Resolution: Example (continued)

Proof by Resolution for Testing a Logical Consequence: Example $\Delta=\{\{P\},\{\neg P, Q\},\{\neg P, R\},\{\neg R\},\{\neg S\}\}$
Step 3: Derive empty clause $\square$ with resolution.

- $C_{1}=\{P\}($ from $\Delta)$
- $C_{2}=\{\neg P, Q\}($ from $\Delta)$
- $C_{3}=\{\neg P, R\}$ (from $\Delta$ )
- $C_{4}=\{\neg R\}($ from $\Delta)$
- $C_{5}=\{Q\}$ (from $C_{1}$ and $C_{2}$ )
- $C_{6}=\{\neg P\}$ (from $C_{3}$ and $C_{4}$ )
- $C_{7}=\square$ (from $C_{1}$ and $\left.C_{6}\right)$

Note: There are shorter proofs. (For example?)

## Another Example

## Another Example for Resolution

Show with resolution, that $\mathrm{KB} \vDash$ DrinkBeer, where

$$
\begin{aligned}
\mathrm{KB}=\{ & (\neg \text { DrinkBeer } \rightarrow \text { EatFish }), \\
& (\text { (EatFish } \wedge \text { DrinkBeer }) \rightarrow \neg \text { EatIceCream }), \\
& ((\text { EatlceCream } \vee \neg \text { DrinkBeer }) \rightarrow \neg \text { EatFish })\} .
\end{aligned}
$$

## Proving that Something Does Not Follow

- We can now use resolution proofs to mechanically show KB $\models \varphi$ whenever a given knowledge base logically implies $\varphi$.
- Question: How can we use the same mechanism to show that something does not follow (KB $\not \vDash \varphi$ )?
