# Discrete Mathematics in Computer Science Syntax of Predicate Logic

Malte Helmert, Gabriele Röger

University of Basel

# Limits of Propositional Logic

Cannot well be expressed in propositional logic:

- "Everyone who does the exercises passes the exam."
- "If someone with administrator privileges presses 'delete', all data is gone."
- "Everyone has a mother."
- "If someone is the father of some person, the person is his child."

# Limits of Propositional Logic

Cannot well be expressed in propositional logic:

- "Everyone who does the exercises passes the exam."
- "If someone with administrator privileges presses 'delete', all data is gone."
- "Everyone has a mother."
- "If someone is the father of some person, the person is his child."

▷ need more expressive logic

→ predicate logic (a.k.a. first-order logic)

German: Prädikatenlogik (erster Stufe)

# Syntax: Building Blocks

- Signatures define allowed symbols.
   analogy: atom set A in propositional logic
- Terms are associated with objects by the semantics.
   no analogy in propositional logic
- Formulas are associated with truth values (true or false) by the semantics.
   analogy: formulas in propositional logic

German: Signatur, Term, Formel

# Signatures: Definition

#### Definition (Signature)

A signature (of predicate logic) is a 4-tuple  $S = \langle V, C, F, P \rangle$  consisting of the following four disjoint sets:

- a finite or countable set  $\mathcal{V}$  of variable symbols
- a finite or countable set C of constant symbols
- a finite or countable set  $\mathcal{F}$  of function symbols
- a finite or countable set *P* of predicate symbols (or relation symbols)

Every function symbol  $f \in \mathcal{F}$  and predicate symbol  $P \in \mathcal{P}$ has an associated arity  $ar(f), ar(P) \in \mathbb{N}_1$  (number of arguments).

German: Variablen-, Konstanten-, Funktions-, Prädikat- und Relationssymbole; Stelligkeit

# Signatures: Terminology and Conventions

#### terminology:

- k-ary (function or predicate) symbol: symbol s with arity ar(s) = k.
- also: unary, binary, ternary

German: k-stellig, unär, binär, ternär

conventions (in this course):

- variable symbols written in *italics*, other symbols upright.
- predicate symbols begin with capital letter, other symbols with lower-case letters

## Signatures: Examples

#### Example: Arithmetic

• 
$$\mathcal{V} = \{x, y, z, x_1, x_2, x_3, \dots\}$$

• 
$$C = \{ \mathsf{zero}, \mathsf{one} \}$$

• 
$$\mathcal{F} = \{\mathsf{sum}, \mathsf{product}\}$$

*ar*(sum) = *ar*(product) = 2, *ar*(Positive) = *ar*(SquareNumber) = 1

## Signatures: Examples

#### Example: Genealogy

• 
$$\mathcal{V} = \{x, y, z, x_1, x_2, x_3, \dots\}$$

• 
$$C = \{$$
roger-federer, lisa-simpson $\}$ 

$$\mathcal{F} = \emptyset$$

• 
$$\mathcal{P} = \{ \mathsf{Female}, \mathsf{Male}, \mathsf{Parent} \}$$

ar(Female) = ar(Male) = 1, ar(Parent) = 2

# Terms: Definition

#### Definition (Term)

Let  $S = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature. A term (over S) is inductively constructed according to the following rules:

- Every variable symbol  $\mathbf{v} \in \mathcal{V}$  is a term.
- Every constant symbol  $\mathbf{c} \in \mathcal{C}$  is a term.
- If  $t_1, \ldots, t_k$  are terms and  $f \in \mathcal{F}$  is a function symbol with arity k, then  $f(t_1, \ldots, t_k)$  is a term.

German: Term

# Terms: Definition

#### Definition (Term)

Let  $S = \langle V, C, F, P \rangle$  be a signature. A term (over S) is inductively constructed according to the following rules:

- Every variable symbol  $\mathbf{v} \in \mathcal{V}$  is a term.
- Every constant symbol  $\mathbf{c} \in \mathcal{C}$  is a term.
- If  $t_1, \ldots, t_k$  are terms and  $f \in \mathcal{F}$  is a function symbol with arity k, then  $f(t_1, \ldots, t_k)$  is a term.

German: Term

examples:

- **X**4
- lisa-simpson
- sum(x<sub>3</sub>, product(one, x<sub>5</sub>))

# Formulas: Definition

#### Definition (Formula)

. . .

For a signature  $S = \langle V, C, F, P \rangle$  the set of predicate logic formulas (over S) is inductively defined as follows:

- If t<sub>1</sub>,..., t<sub>k</sub> are terms (over S) and P ∈ P is a k-ary predicate symbol, then the atomic formula (or the atom) P(t<sub>1</sub>,..., t<sub>k</sub>) is a formula over S.
- If  $t_1$  and  $t_2$  are terms (over S), then the identity  $(t_1 = t_2)$  is a formula over S.
- If x ∈ V is a variable symbol and φ a formula over S, then the universal quantification ∀x φ and the existential quantification ∃x φ are formulas over S.

German: atomare Formel, Atom, Identität, Allquantifizierung, Existenzquantifizierung

# Formulas: Definition

#### Definition (Formula)

. . .

For a signature  $S = \langle V, C, F, P \rangle$  the set of predicate logic formulas (over S) is inductively defined as follows:

- If  $\varphi$  is a formula over S, then so is its negation  $\neg \varphi$ .
- If φ and ψ are formulas over S, then so are the conjunction (φ ∧ ψ) and the disjunction (φ ∨ ψ).

German: Negation, Konjunktion, Disjunktion

## Formulas: Examples

#### Examples: Arithmetic and Genealogy

- Positive(x<sub>2</sub>)
- $\forall x (\neg SquareNumber(x) \lor Positive(x))$
- $\exists x_3 (SquareNumber(x_3) \land \neg Positive(x_3))$

$$\forall x (x = y)$$

- $\forall x (sum(x, x) = product(x, one))$
- $\forall x \exists y (sum(x, y) = zero)$
- $\forall x \exists y ( \mathsf{Parent}(y, x) \land \mathsf{Female}(y))$

Terminology: The symbols  $\forall$  and  $\exists$  are called quantifiers.

### German: Quantoren

Abbreviations and Placement of Parentheses by Convention

abbreviations:

- $(\varphi \to \psi)$  is an abbreviation for  $(\neg \varphi \lor \psi)$ .
- $(\varphi \leftrightarrow \psi)$  is an abbreviation for  $((\varphi \rightarrow \psi) \land (\psi \rightarrow \varphi))$ .
- Sequences of the same quantifier can be abbreviated.
   For example:
  - $\forall x \forall y \forall z \varphi \rightsquigarrow \forall x y z \varphi$
  - $\blacksquare \exists x \exists y \exists z \varphi \rightsquigarrow \exists x y z \varphi$
  - $\forall w \exists x \exists y \forall z \varphi \rightsquigarrow \forall w \exists xy \forall z \varphi$

Abbreviations and Placement of Parentheses by Convention

abbreviations:

- $(\varphi \rightarrow \psi)$  is an abbreviation for  $(\neg \varphi \lor \psi)$ .
- $(\varphi \leftrightarrow \psi)$  is an abbreviation for  $((\varphi \rightarrow \psi) \land (\psi \rightarrow \varphi))$ .
- Sequences of the same quantifier can be abbreviated.
   For example:
  - $\forall x \forall y \forall z \varphi \rightsquigarrow \forall x y z \varphi$
  - $\blacksquare \exists x \exists y \exists z \varphi \rightsquigarrow \exists x y z \varphi$
  - $\forall w \exists x \exists y \forall z \varphi \rightsquigarrow \forall w \exists xy \forall z \varphi$

placement of parentheses by convention:

- analogous to propositional logic
- quantifiers  $\forall$  and  $\exists$  bind more strongly than anything else.

■ example:  $\forall x P(x) \rightarrow Q(x)$  corresponds to  $(\forall x P(x) \rightarrow Q(x))$ , not  $\forall x (P(x) \rightarrow Q(x))$ .

### Exercise

$$\begin{aligned} \mathcal{S} &= \langle \{x,y,z\}, \{\mathsf{c}\}, \{\mathsf{f},\mathsf{g},\mathsf{h}\}, \{\mathsf{Q},\mathsf{R},\mathsf{S}\} \rangle \text{ with } \\ ar(\mathsf{f}) &= 3, ar(\mathsf{g}) = ar(\mathsf{h}) = 1, ar(\mathsf{Q}) = 2, ar(\mathsf{R}) = ar(\mathsf{S}) = 1 \end{aligned}$$

■ f(*x*, *y*)

$$(g(x) = \mathsf{R}(y))$$

- (g(x) = f(y, c, h(x)))
- $(\mathsf{R}(x) \land \forall x \,\mathsf{S}(x))$
- ∀c Q(c, x)

$$(\forall x \exists y (g(x) = y) \lor (h(x) = c))$$

Which expressions are syntactically correct formulas or terms for  $\mathcal{S}?$  What kind of term/formula?

# Discrete Mathematics in Computer Science Semantics of Predicate Logic

Malte Helmert, Gabriele Röger

University of Basel

## Semantics: Motivation

- interpretations in propositional logic: truth assignments for the propositional variables
- There are no propositional variables in predicate logic.
- instead: interpretation determines meaning of the constant, function and predicate symbols.
- meaning of variable symbols not determined by interpretation but by separate variable assignment

## Interpretations and Variable Assignments

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

Definition (Interpretation, Variable Assignment)

An interpretation (for S) is a pair  $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  of:

- a non-empty set U called the universe and
- a function ·<sup>I</sup> that assigns a meaning to the constant, function, and predicate symbols:
  - $c^{\mathcal{I}} \in U$  for constant symbols  $c \in C$
  - $f^{\mathcal{I}}: U^k \to U$  for *k*-ary function symbols  $f \in \mathcal{F}$
  - $\mathsf{P}^{\mathcal{I}} \subseteq U^k$  for *k*-ary predicate symbols  $\mathsf{P} \in \mathcal{P}$

A variable assignment (for S and universe U) is a function  $\alpha : \mathcal{V} \to U$ .

German: Interpretation, Universum (or Grundmenge), Variablenzuweisung

### Interpretations and Variable Assignments: Example

#### Example

signature:  $S = \langle V, C, F, P \rangle$  with  $V = \{x, y, z\}$ ,  $C = \{\text{zero, one}\}, F = \{\text{sum, product}\}, P = \{\text{SquareNumber}\}$ ar(sum) = ar(product) = 2, ar(SquareNumber) = 1

## Interpretations and Variable Assignments: Example

#### Example

signature: 
$$S = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$$
 with  $\mathcal{V} = \{x, y, z\}$ ,  
 $\mathcal{C} = \{\text{zero, one}\}, \mathcal{F} = \{\text{sum, product}\}, \mathcal{P} = \{\text{SquareNumber}\}$   
 $ar(\text{sum}) = ar(\text{product}) = 2, ar(\text{SquareNumber}) = 1$   
 $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  with  
 $\mathbf{U} = \{u_0, u_1, u_2, u_3, u_4, u_5, u_6\}$   
 $\mathbf{z} \text{ero}^{\mathcal{I}} = u_0$   
 $\mathbf{u} \text{one}^{\mathcal{I}} = u_1$   
 $\mathbf{u} \text{sum}^{\mathcal{I}}(u_i, u_j) = u_{(i+j) \mod 7} \text{ for all } i, j \in \{0, \dots, 6\}$   
 $\mathbf{u} \text{ product}^{\mathcal{I}}(u_i, u_j) = u_{(i\cdot j) \mod 7} \text{ for all } i, j \in \{0, \dots, 6\}$   
 $\mathbf{u} \text{ SquareNumber}^{\mathcal{I}} = \{u_0, u_1, u_2, u_4\}$   
 $\alpha = \{x \mapsto u_5, y \mapsto u_5, z \mapsto u_0\}$ 

## Semantics: Informally

Example:  $(\forall x (Block(x) \rightarrow Red(x)) \land Block(a))$ "For all objects x: if x is a block, then x is red. Also, the object called a is a block."

- **Terms** are interpreted as objects.
- Unary predicates denote properties of objects (to be a block, to be red, to be a square number, ...).
- General predicates denote relations between objects (to be someone's child, to have a common divisor, ...).
- Universally quantified formulas ("∀") are true if they hold for every object in the universe.
- Existentially quantified formulas ("∃") are true if they hold for at least one object in the universe.

### Interpretations of Terms

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

#### Definition (Interpretation of a Term)

Let  $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  be an interpretation for S, and let  $\alpha$  be a variable assignment for S and universe U. Let t be a term over S. The interpretation of t under  $\mathcal{I}$  and  $\alpha$ , written as  $t^{\mathcal{I},\alpha}$ , is the element of the universe U defined as follows:

If 
$$t = x$$
 with  $x \in \mathcal{V}$  ( $t$  is a variable term):  
 $x^{\mathcal{I},\alpha} = \alpha(x)$ 

If t = c with  $c \in C$  (t is a constant term):  $c^{\mathcal{I},\alpha} = c^{\mathcal{I}}$ 

If 
$$t = f(t_1, \ldots, t_k)$$
 (t is a function term):  
 $f(t_1, \ldots, t_k)^{\mathcal{I}, \alpha} = f^{\mathcal{I}}(t_1^{\mathcal{I}, \alpha}, \ldots, t_k^{\mathcal{I}, \alpha})$ 

## Interpretations of Terms: Example

#### Example

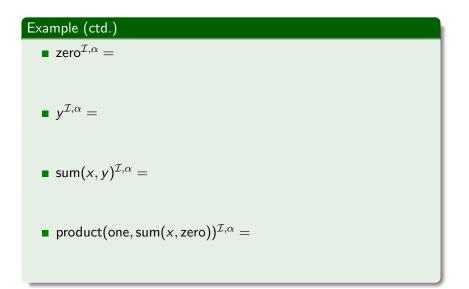

signature:  $S = \langle V, C, F, P \rangle$ with  $V = \{x, y, z\}$ ,  $C = \{\text{zero, one}\}$ ,  $F = \{\text{sum, product}\}$ , ar(sum) = ar(product) = 2

## Interpretations of Terms: Example

#### Example

signature: 
$$S = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$$
  
with  $\mathcal{V} = \{x, y, z\}, C = \{\text{zero, one}\}, \mathcal{F} = \{\text{sum, product}\},$   
 $ar(\text{sum}) = ar(\text{product}) = 2$   
 $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  with  
 $\mathbf{U} = \{u_0, u_1, u_2, u_3, u_4, u_5, u_6\}$   
 $\mathbf{z} \text{ero}^{\mathcal{I}} = u_0$   
 $\mathbf{u} \text{one}^{\mathcal{I}} = u_1$   
 $\mathbf{u} \text{sum}^{\mathcal{I}}(u_i, u_j) = u_{(i+j) \mod 7} \text{ for all } i, j \in \{0, \dots, 6\}$   
 $\mathbf{u} \text{ product}^{\mathcal{I}}(u_i, u_j) = u_{(i \cdot j) \mod 7} \text{ for all } i, j \in \{0, \dots, 6\}$   
 $\alpha = \{x \mapsto u_5, y \mapsto u_5, z \mapsto u_0\}$ 

Interpretations of Terms: Example (ctd.)

## Semantics of Predicate Logic Formulas

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

#### Definition (Formula is Satisfied or True)

Let  $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  be an interpretation for S, and let  $\alpha$  be a variable assignment for S and universe U. We say that  $\mathcal{I}$  and  $\alpha$  satisfy a predicate logic formula  $\varphi$ (also:  $\varphi$  is true under  $\mathcal{I}$  and  $\alpha$ ), written:  $\mathcal{I}, \alpha \models \varphi$ , according to the following inductive rules:

$$\begin{split} \mathcal{I}, \alpha &\models \mathsf{P}(t_1, \dots, t_k) & \text{iff } \langle t_1^{\mathcal{I}, \alpha}, \dots, t_k^{\mathcal{I}, \alpha} \rangle \in \mathsf{P}^{\mathcal{I}} \\ \mathcal{I}, \alpha &\models (t_1 = t_2) & \text{iff } t_1^{\mathcal{I}, \alpha} = t_2^{\mathcal{I}, \alpha} \\ \mathcal{I}, \alpha &\models \neg \varphi & \text{iff } \mathcal{I}, \alpha \not\models \varphi \\ \mathcal{I}, \alpha &\models (\varphi \land \psi) & \text{iff } \mathcal{I}, \alpha \models \varphi \text{ and } \mathcal{I}, \alpha \models \psi \\ \mathcal{I}, \alpha &\models (\varphi \lor \psi) & \text{iff } \mathcal{I}, \alpha \models \varphi \text{ or } \mathcal{I}, \alpha \models \psi \end{split}$$

German:  $\mathcal{I}$  und  $\alpha$  erfüllen  $\varphi$  (also:  $\varphi$  ist wahr unter  $\mathcal{I}$  und  $\alpha$ )

. . .

## Semantics of Predicate Logic Formulas

Let  $\mathcal{S} = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$  be a signature.

. . .

Definition (Formula is Satisfied or True)

$$\mathcal{I}, \alpha \models orall x arphi \quad ext{iff } \mathcal{I}, \alpha[x := u] \models arphi ext{ for all } u \in U$$

 $\mathcal{I}, \alpha \models \exists x \varphi \quad \text{iff} \ \mathcal{I}, \alpha[x := u] \models \varphi \ \text{for at least one} \ u \in U$ 

where  $\alpha[x := u]$  is the same variable assignment as  $\alpha$ , except that it maps variable x to the value u. Formally:

$$(\alpha[x := u])(z) = \begin{cases} u & \text{if } z = x \\ \alpha(z) & \text{if } z \neq x \end{cases}$$

### Semantics: Example

#### Example

signature:  $S = \langle \mathcal{V}, \mathcal{C}, \mathcal{F}, \mathcal{P} \rangle$ with  $\mathcal{V} = \{x, y, z\}$ ,  $\mathcal{C} = \{a, b\}$ ,  $\mathcal{F} = \emptyset$ ,  $\mathcal{P} = \{Block, Red\}$ , ar(Block) = ar(Red) = 1.

## Semantics: Example

### Example

signature: 
$$S = \langle \mathcal{V}, C, \mathcal{F}, \mathcal{P} \rangle$$
  
with  $\mathcal{V} = \{x, y, z\}, C = \{a, b\}, \mathcal{F} = \emptyset, \mathcal{P} = \{Block, Red\},$   
 $ar(Block) = ar(Red) = 1.$   
 $\mathcal{I} = \langle U, \cdot^{\mathcal{I}} \rangle$  with  
 $\mathbf{U} = \{u_1, u_2, u_3, u_4, u_5\}$   
 $\mathbf{u} a^{\mathcal{I}} = u_1$   
 $\mathbf{b}^{\mathcal{I}} = u_3$   
 $\mathbf{Block}^{\mathcal{I}} = \{u_1, u_2\}$   
 $\mathbf{Red}^{\mathcal{I}} = \{u_1, u_2, u_3, u_5\}$   
 $\alpha = \{x \mapsto u_1, y \mapsto u_2, z \mapsto u_1\}$ 

# Semantics: Example (ctd.)

### Example (ctd.)

Questions:

- $\mathcal{I}, \alpha \models (\mathsf{Block}(\mathsf{b}) \lor \neg \mathsf{Block}(\mathsf{b}))$ ?
- $\mathcal{I}, \alpha \models (\mathsf{Block}(x) \rightarrow (\mathsf{Block}(x) \lor \neg \mathsf{Block}(y)))?$
- $\mathcal{I}, \alpha \models (\mathsf{Block}(\mathsf{a}) \land \mathsf{Block}(\mathsf{b}))$ ?
- $\mathcal{I}, \alpha \models \forall x (\mathsf{Block}(x) \to \mathsf{Red}(x))?$
