

# Planning and Optimization

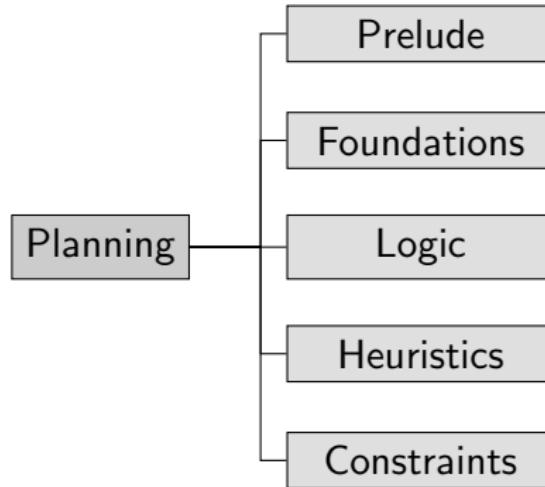

## A2. What is Planning?

Malte Helmert and Gabriele Röger

Universität Basel

September 21, 2022

# Content of this Course

# Before We Start...

**Prelude** (Chapters A1–A3): very high-level intro to planning

- our goal: give you a little feeling what planning is about
- **preface** to the actual course
- ~~> main course content (beginning with Chapter B1)  
will be mathematically formal and rigorous
- You can ignore the prelude when preparing for the exam.

# Planning

## General Problem Solving

## Wikipedia: General Problem Solver

General Problem Solver (GPS) was a computer program created in 1959 by Herbert Simon, J.C. Shaw, and Allen Newell intended to work as a universal problem solver machine.

Any formalized symbolic problem can be solved, in principle, by GPS. [...]

GPS was the first computer program which separated its knowledge of problems (rules represented as input data) from its strategy of how to solve problems (a generic solver engine).

- ~~ these days called “domain-independent automated **planning**”
- ~~ this is what the course is about

# So What is Domain-Independent Automated Planning?

## Automated Planning (Pithy Definition)

“Planning is the art and practice of thinking before acting.”

— Patrik Haslum

## Automated Planning (More Technical Definition)

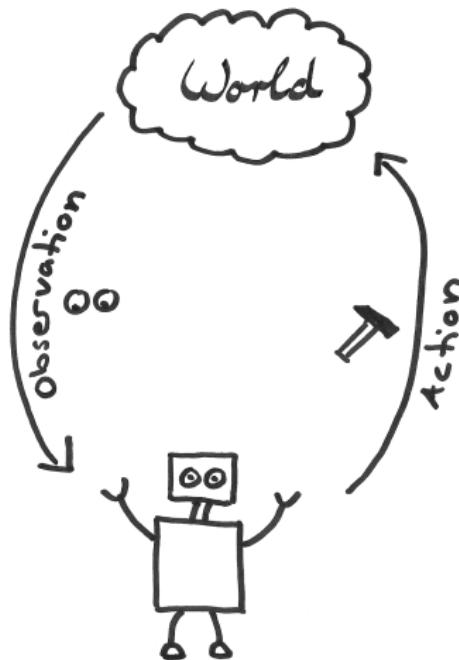

“Selecting a goal-leading course of action  
based on a high-level description of the world.”

— Jörg Hoffmann

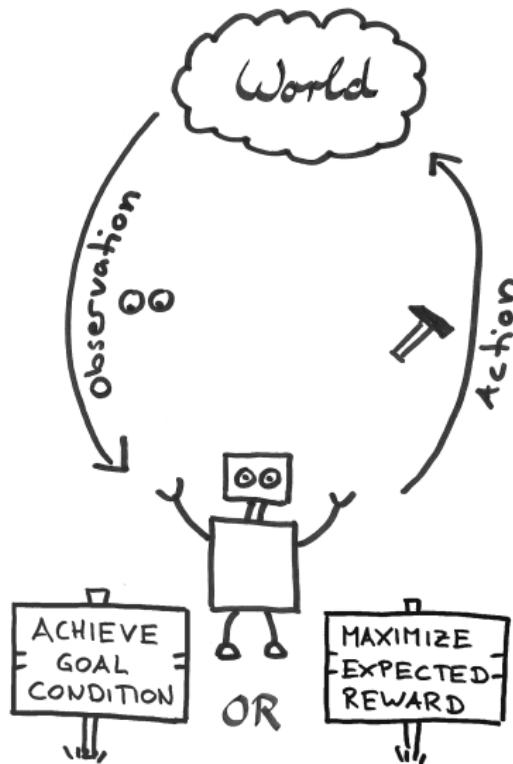

## Domain-Independence of Automated Planning

Create **one** planning algorithm that performs sufficiently well  
on **many** application domains (including future ones).

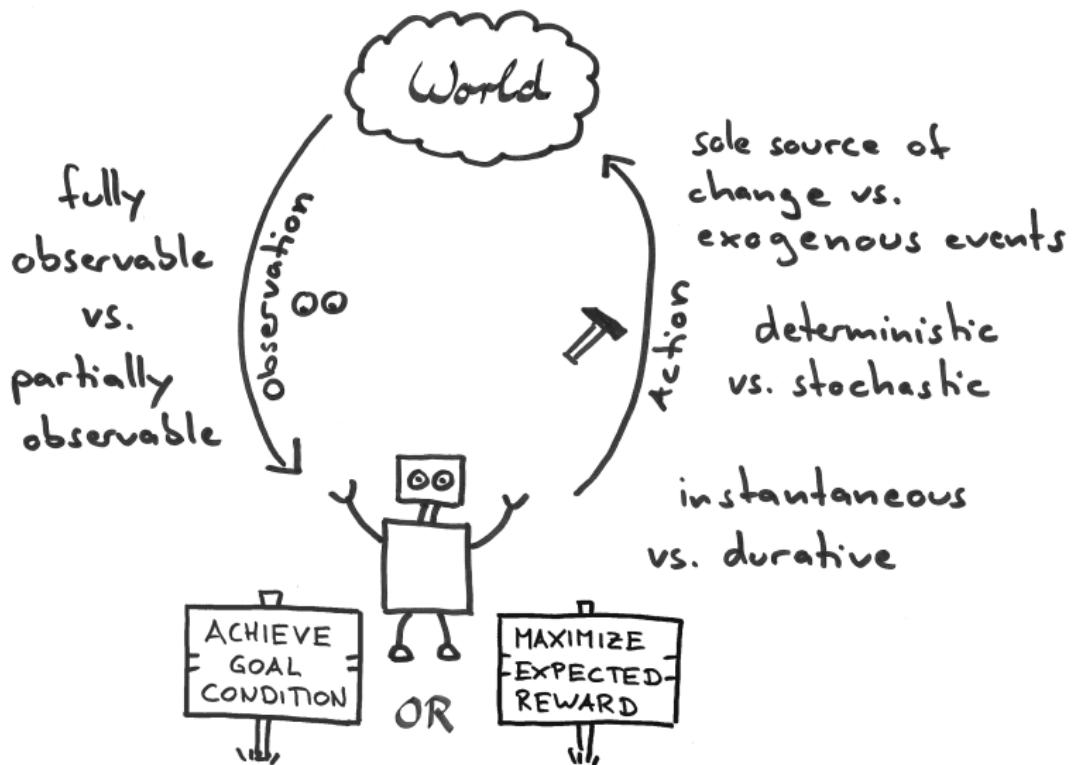

# General Perspective on Planning

# General Perspective on Planning

# General Perspective on Planning

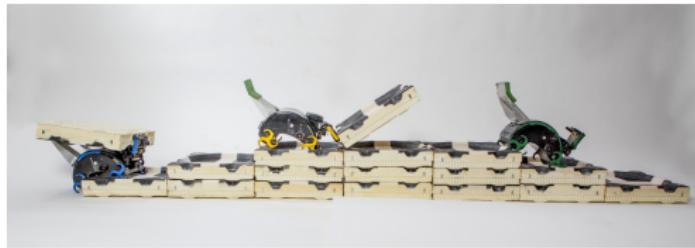

## Example: Earth Observation

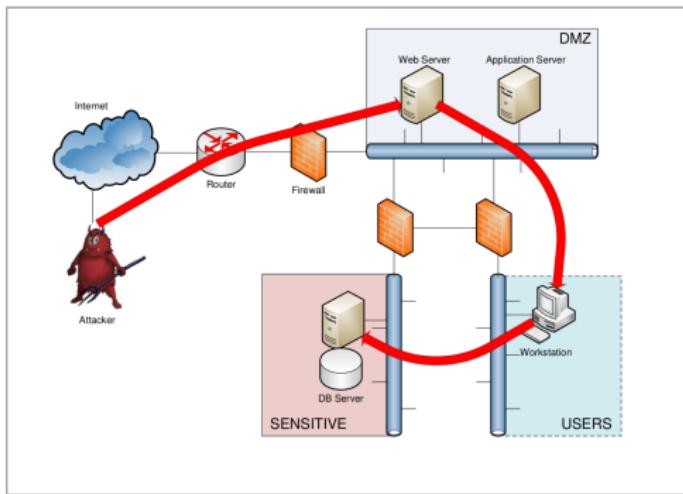

- satellite takes images of patches on Earth
- use [weather forecast](#) to optimize probability of high-quality images

## Example: Termes

Harvard TERMES robots, based on termites

# Example: Cybersecurity

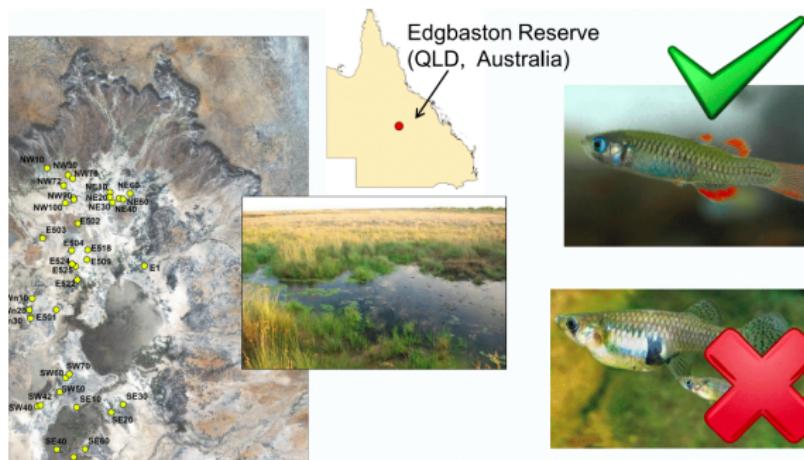

CALDERA automated adversary emulation system

# Example: Intelligent Greenhouse

photo © LemnaTec GmbH

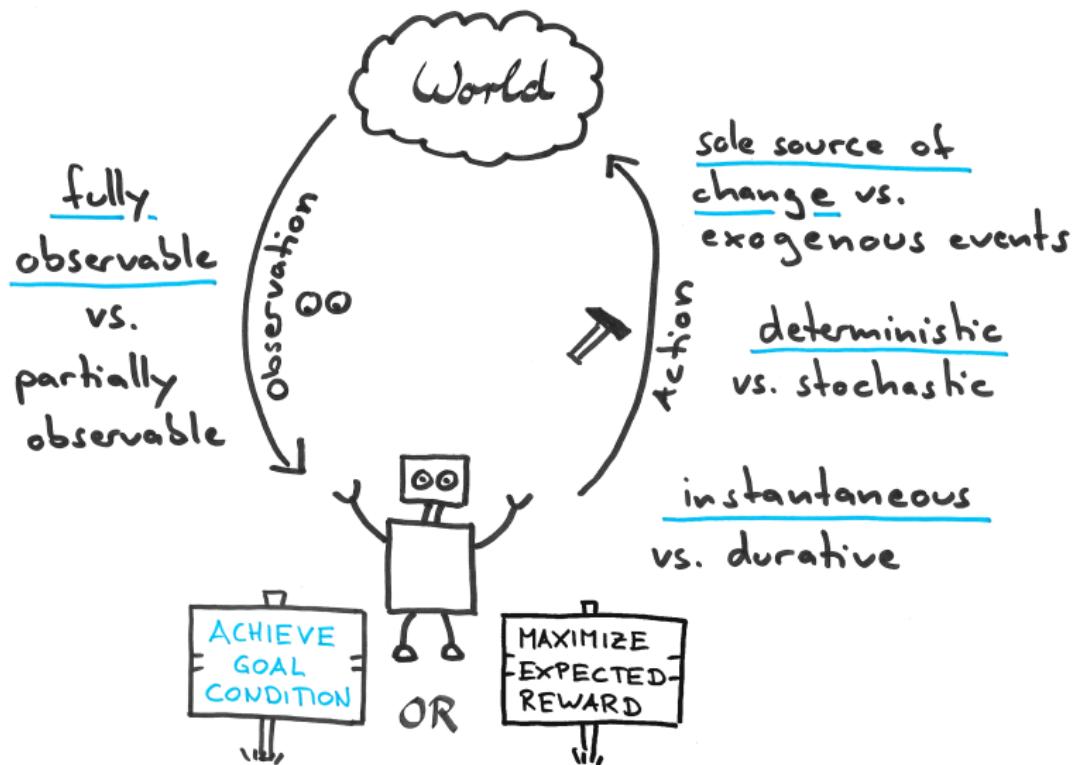

Example: Red-finned Blue-eye

Picture by Iadine Chadès

- red-finned blue-eye population threatened by *gambusia*
- springs connected probabilistically during rain season
- find strategy to *save* red-finned blue-eye from *extinction*

# Classical Planning

# Model-based vs. Data-driven Approaches

Model-based approaches know  
the “inner workings” of the world  
~~ reasoning

Data-driven approaches rely only  
on collected data from a black-box world  
~~ learning

We focus on model-based approaches.

# Planning Tasks

input to a planning algorithm: **planning task**

- initial state of the world
- actions that change the state
- goal to be achieved

output of a planning algorithm:

- **plan**: sequence of actions taking initial state to a goal state
- or confirmation that no plan exists

~~ formal definitions later in the course

# The Planning Research Landscape

- one of the major subfields of Artificial Intelligence (AI)
- represented at major AI conferences (IJCAI, AAAI, ECAI)
- annual specialized conference ICAPS ( $\approx$  250 participants)
- major journals: general AI journals (AIJ, JAIR)

# Planning Task Examples

# Example: The Seven Bridges of Königsberg

# How Hard is Planning?

## Classical Planning as State-Space Search

## classical planning as state-space search:

⇒ much more on this later in the course

# Is Planning Difficult?

Classical planning is computationally challenging:

- number of states grows **exponentially** with description size when using (propositional) logic-based representations
- **provably hard** (PSPACE-complete)

~~ we prove this later in the course

problem sizes:

- Seven Bridges of Königsberg: **64** reachable states
- Rubik's Cube:  **$4.325 \cdot 10^{19}$**  reachable states
  - ~~ consider 2 billion/second ~~ 1 billion years
- standard benchmarks: some with  **$> 10^{200}$**  reachable states

Planning  
oooooooooooo

Task Examples  
oooo

How Hard is Planning?  
ooo

Summary  
●○

# Summary

# Summary

- **planning** = thinking before acting
- major subarea of Artificial Intelligence
- **domain-independent** planning = general problem solving
- **classical planning** = the “easy case”  
(deterministic, fully observable etc.)
- still hard enough!  
~~ PSPACE-complete because of huge number of states
- often solved by **state-space search**
- number of states grows **exponentially** with input size
