# A3.1 Mathematical Induction

# **Proof Techniques**

## most common proof techniques:

- direct proof
- indirect proof (proof by contradiction)
- contrapositive
- mathematical induction
- structural induction

## Mathematical Induction

Concrete Mathematics by Graham, Knuth and Patashnik (p. 3) Mathematical induction proves that we can climb as high as we like on a ladder, by proving that we can climb onto the bottom rung (the basis)

and that

from each rung we can climb up to the next one (the step).

## Propositions

Consider a statement on all natural numbers n with  $n \ge m$ .

- ► E.g. "Every natural number n ≥ 2 can be written as a product of prime numbers."
  - P(2): "2 can be written as a product of prime numbers."
  - P(3): "3 can be written as a product of prime numbers."
  - P(4): "4 can be written as a product of prime numbers."
  - ▶ ...
  - P(n): "n can be written as a product of prime numbers."
  - For every natural number  $n \ge 2$  proposition P(n) is true.

# Proposition P(n) is a mathematical statement that is defined in terms of natural number n.

## Mathematical Induction

# Mathematical Induction Proof (of the truth) of proposition P(n) for all natural numbers n with n ≥ m: basis: proof of P(m) induction hypothesis (IH): suppose that P(k) is true for all k with m ≤ k ≤ n inductive step: proof of P(n+1)

using the induction hypothesis

#### A3. Proofs II

# Mathematical Induction: Example I

# Theorem For all $n \in \mathbb{N}_0$ with $n \ge 1$ : $\sum_{i=1}^n (2i-1) = n^2$ Proof. Mathematical induction over n: basis n = 1: $\sum_{i=1}^{1} (2i - 1) = 2 \cdot 1 - 1 = 1 = 1^2$ IH: $\sum_{i=1}^{k} (2i-1) = k^2$ for all $1 \le k \le n$ inductive step $n \rightarrow n + 1$ : $\sum_{i=1}^{n+1} (2i-1) = \left(\sum_{i=1}^{n} (2i-1)\right) + \left(2(n+1)-1\right)$ $\stackrel{\text{IH}}{=} n^2 + (2(n+1) - 1)$ $= n^{2} + 2n + 1 = (n + 1)^{2}$

. . .

## Mathematical Induction: Example II

## Theorem

Every natural number  $n \ge 2$  can be written as a product of prime numbers, i. e.  $n = p_1 \cdot p_2 \cdot \ldots \cdot p_m$  with prime numbers  $p_1, \ldots, p_m$ .

## Proof. Mathematical Induction over *n*: basis n = 2: trivially satisfied, since 2 is prime IH: Every natural number *k* with $2 \le k \le n$

can be written as a product of prime numbers.

## Mathematical Induction: Example II

## Theorem

Every natural number  $n \ge 2$  can be written as a product of prime numbers, i. e.  $n = p_1 \cdot p_2 \cdot \ldots \cdot p_m$  with prime numbers  $p_1, \ldots, p_m$ .

```
Proof (continued).
inductive step n \rightarrow n + 1:
  • Case 1: n+1 is a prime number \rightsquigarrow trivial
  Case 2: n+1 is not a prime number.
      There are natural numbers 2 \leq q, r \leq n with n+1 = q \cdot r.
      Using IH shows that there are prime numbers
      q_1, \ldots, q_s with q = q_1 \cdot \ldots \cdot q_s and
      r_1,\ldots,r_t with r=r_1\cdot\ldots\cdot r_t.
      Together this means n + 1 = q_1 \cdot \ldots \cdot q_s \cdot r_1 \cdot \ldots \cdot r_t.
```

## Weak vs. Strong Induction

- Weak induction: Induction hypothesis only supposes that P(k) is true for k = n
- Strong induction: Induction hypothesis supposes that P(k) is true for all k ∈ N<sub>0</sub> with m ≤ k ≤ n
   also: complete induction

Our previous definition corresponds to strong induction.

Which of the examples had also worked with weak induction?

# Is Strong Induction More Powerful than Weak Induction?

Are there statements that we can prove with strong induction but not with weak induction?

We can always use a stronger proposition:

- "Every n ∈ N₀ with n ≥ 2 can be written as a product of prime numbers."
- ▶ *P*(*n*): "*n* can be written as a product of prime numbers."
- P'(n): "all k ∈ N₀ with 2 ≤ k ≤ n can be written as a product of prime numbers."

# A3.2 Structural Induction

#### A3. Proofs II

# Inductively Defined Sets: Examples

## Example (Natural Numbers)

The set  $\mathbb{N}_0$  of natural numbers is inductively defined as follows:

- 0 is a natural number.
- If *n* is a natural number, then n + 1 is a natural number.

## Example (Binary Tree)

The set  $\mathcal B$  of binary trees is inductively defined as follows:

- ▶ □ is a binary tree (a leaf)
- If L and R are binary trees, then (L, ○, R) is a binary tree (with inner node ○).

## Implicit statement: all elements of the set can be constructed by finite application of these rules

#### A3. Proofs II

## Inductive Definition of a Set

## Inductive Definition

A set M can be defined inductively by specifying

basic elements that are contained in M

construction rules of the form "Given some elements of *M*, another element of *M* can be constructed like this."

## Structural Induction

## Structural Induction

Proof of statement for all elements of an inductively defined set

- basis: proof of the statement for the basic elements
- induction hypothesis (IH):

suppose that the statement is true for some elements M

 inductive step: proof of the statement for elements constructed by applying a construction rule to M (one inductive step for each construction rule) A3. Proofs II

# Structural Induction: Example (1)

Definition (Leaves of a Binary Tree) The number of leaves of a binary tree *B*, written *leaves*(*B*), is defined as follows:

$$\mathit{leaves}(\Box) = 1$$
  
 $\mathit{leaves}(\langle L, \bigcirc, R 
angle) = \mathit{leaves}(L) + \mathit{leaves}(R)$ 

## Definition (Inner Nodes of a Binary Tree)

The number of inner nodes of a binary tree B, written inner(B), is defined as follows:

$$inner(\Box) = 0$$
  
 $inner(\langle L, \bigcirc, R \rangle) = inner(L) + inner(R) + 1$ 

## Structural Induction: Example (2)

## Theorem

For all binary trees B: inner(B) = leaves(B) - 1.

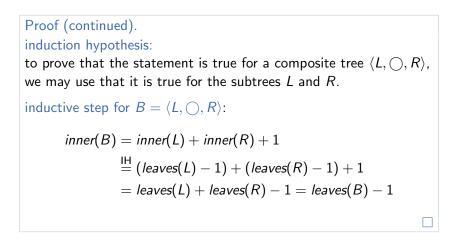

```
Proof.

induction basis:

inner(\Box) = 0 = 1 - 1 = leaves(\Box) - 1

\rightsquigarrow statement is true for base case ....
```

# Structural Induction: Example (3)

## Example: Tarradiddles

## Example (Tarradiddles)

The set of tarradiddles is inductively defined as follows:

- ► → is a tarradiddle.
- V is a tarradiddle.
- If x and y are tarradiddles, then x and y is a tarradiddle.
- If x and y are tarradiddles, then  $x \rightarrow y$  is a tarradiddle.

How do you prove with structural induction that every tarradiddle contains an even number of flowers?

# Summary

- Mathematical induction is used to prove a proposition P for all natural numbers  $\geq m$ .
  - Prove P(m).
  - Make hypothesis that P(k) is true for  $m \le k \le n$ .
  - Establish P(n+1) using the hypothesis.
- Structural induction applies the same general concept to prove a proposition P for all elements of an inductively defined set.
