. Equivalence and Order Relations Relations: Recap	Equivalence I	Relations

- A relation over sets S_1, \ldots, S_n is a set $R \subseteq S_1 \times \cdots \times S_n$.
- ▶ Possible properties of homogeneous relations *R* over *S*:
 - ▶ reflexive: $(x, x) \in R$ for all $x \in S$
 - irreflexive: $(x, x) \notin R$ for all $x \in S$
 - **symmetric:** $(x, y) \in R$ iff $(y, x) \in R$
 - ▶ asymmetric: if $(x, y) \in R$ then $(y, x) \notin R$
 - ▶ antisymmetric: if $(x, y) \in R$ then $(y, x) \notin R$ or x = y
 - **transitive:** if $(x, y) \in R$ and $(y, z) \in R$ then $(x, z) \in R$

B6. Equivalence and Order Relations

e.g. their color.

Would this relation be

reflexive?

irreflexive?

symmetric?asymmetric?

antisymmetric?transitive?

e.g. one bucket for each color.

Motivation

Equivalence Relation

B6. Equivalence and Order Relations

Definition (Equivalence Relation)

A binary relation \sim over set S is an equivalence relation if \sim is reflexive, symmetric and transitive.

Examples:

- {(x, y) | x and y have the same place of origin} over the set of all Swiss citizens
- $\{(x, y) \mid x \text{ and } y \text{ have the same parity} \} \text{ over } \mathbb{N}_0$
- $\{ (1,1), (1,4), (1,5), (4,1), (4,4), (4,5), (5,1), (5,4), (5,5), \\ (2,2), (2,3), (3,2), (3,3) \} \text{ over } \{1,2,\ldots,5\}$

Is this definition indeed what we want? Does it allow us to partition the objects into buckets (e.g. one "bucket" for all objects that share a specific color)?

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

B6. Equivalence and Order Relations Equivalence Classes Definition (equivalence class) Let ~ be an equivalence relation over set S. For any $x \in S$, the equivalence class of x is the set $[x]_{\sim} = \{y \in S \mid x \sim y\}.$ Consider $\sim = \{(1, 1), (1, 4), (1, 5), (4, 1), (4, 4), (4, 5), (5, 1), (5, 4), (5, 5), (2, 2), (2, 3), (3, 2), (3, 3)\}$ over set $\{1, 2, \dots, 5\}.$ $[4]_{\sim} =$

Think of any attribute that two objects can have in common,

▶ We could place the objects into distinct "buckets",

• We also can define a relation \sim such that $x \sim y$ iff

x and y share the attribute, e.g.have the same color.

Order Relations

B6.2 Order Relations

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

B6. Equivalence and Order Relations

Partial Orders

- ► We begin with partial orders.
- ▶ Example partial order relations are \leq over \mathbb{N}_0 or \subseteq for sets.
- Are these relations
 - reflexive?
 - irreflexive?
 - symmetric?
 - asymmetric?
 - antisymmetric?
 - transitive?

B6. Equivalence and Order Relations Partial Orders – Definition Order Relations

Definition (Partial order)

A binary relation \leq over set S is a partial order if \leq is reflexive, antisymmetric and transitive.

Which of these relations are partial orders?

- \blacktriangleright strict subset relation \subset for sets
- \blacktriangleright not-less-than relation \geq over \mathbb{N}_0
- $R = \{(a, a), (a, b), (b, b), (b, c), (c, c)\}$ over $\{a, b, c\}$

Least and Greatest Element

Definition (Least and greatest element) Let \leq be a partial order over set S. An element $x \in S$ is the least element of S if for all $y \in S$ it holds that $x \leq y$. It is the greatest element of S if for all $y \in S$, $y \leq x$.

▶ Is there a least/greatest element? Which one?

▶
$$S = \{1, 2, 3\}$$
 and $\leq = \{(x, y) \mid x, y \in S \text{ and } x \leq y\}$

- ▶ relation \leq over \mathbb{N}_0
- ▶ relation \leq over \mathbb{Z}
- Why can we say the least element instead of a least element?

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

Uniqueness of Least Element

Theorem

Let \leq be a partial order over set S. If S contains a least element, it contains exactly one least element.

Proof.

By contradiction: Assume x, y are least elements of S with $x \neq y$. Since x is a least element, $x \leq y$ is true. Since y is a least element, $y \leq x$ is true. As a partial order is antisymmetric, this implies that x = y. $\frac{1}{2}$

Analogously: If there is a greatest element then is unique.

Order Relations

Strict Total Orders – Definition

Definition (Trichotomy) A binary relation R over set S is trichotomous if for all $x, y \in S$ exactly one of xRy, yRx or x = y is true.

Definition (Strict total order)

A binary relation \prec over S is a strict total order if \prec is trichotomous and a strict order.

A strict total order completely ranks the elements of set S. Example: < relation over \mathbb{N}_0 gives the standard ordering $0, 1, 2, 3, \ldots$ of natural numbers.

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

B6. Equivalence and Order Relations Special Elements – Example Consider again the previous example: $S = \{Pasta, Potato, Bread, Rice\}$ $\prec = \{(Pasta, Potato), (Bread, Potato),$ $(Rice, Potato), (Rice, Bread)\}$ \overrightarrow{Potato} \overrightarrow{Rice} Is there a least and a greatest element? Which elements are maximal or minimal?

Special Elements

Special elements are defined almost as for partial orders:

Definition (Least/greatest/minimal/maximal element of a set) Let \prec be a strict order over set S. An element $x \in S$ is the least element of Sif for all $y \in S$ where $y \neq x$ it holds that $x \prec y$. It is the greatest element of S if for all $y \in S$ where $y \neq x, y \prec x$. Element $x \in S$ is a minimal element of Sif there is no $y \in S$ with $y \prec x$. It is a maximal element of S

if there is no $y \in S$ with $x \prec y$.
