# Example: Freecell

Example (Good and Bad Effects)

If we move  $K\diamondsuit$  to a free tableau position, the good effect is that  $4\clubsuit$  is now accessible.

The bad effect is that we lose one free tableau position.

Planning and Optimization

Question: Which operator effects are good, and which are bad?

We now consider a reformulation of propositional planning tasks that makes the distinction between good and bad effects obvious.

Difficult to answer in general, because it depends on context:

Locking our door is good if we want to keep burglars out.

Locking our door is bad if we want to enter.

B5. Positive Normal Form and STRIPS

What is a Good or Bad Effect?

Positive Normal Form

#### Positive Formulas, Operators and Tasks

#### Definition (Positive Formula)

A logical formula  $\varphi$  is positive if no negation symbols appear in  $\varphi$ .

Note: This includes the negation symbols implied by  $\rightarrow$  and  $\leftrightarrow$ .

#### Definition (Positive Operator)

An operator o is positive if pre(o) and all effect conditions in eff(o) are positive.

#### Definition (Positive Propositional Planning Task)

A propositional planning task  $\langle V, I, O, \gamma \rangle$  is positive if all operators in O and the goal  $\gamma$  are positive.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 2, 2023

## Positive Normal Form

#### Definition (Positive Normal Form)

A propositional planning task is in positive normal form if it is positive and all operator effects are flat.

# Positive Normal Form: Existence

#### Theorem (Positive Normal Form)

For every propositional planning task  $\Pi$ , there is an equivalent propositional planning task  $\Pi'$  in positive normal form. Moreover,  $\Pi'$  can be computed from  $\Pi$  in polynomial time.

Note: Equivalence here means that the transition systems induced by  $\Pi$  and  $\Pi'$ , restricted to the reachable states, are isomorphic.

We prove the theorem by describing a suitable algorithm. (However, we do not prove its correctness or complexity.)

B5. Positive Normal Form and STRIPS

Positive Normal Form

#### Positive Normal Form: Algorithm

#### Transformation of $\langle V, I, O, \gamma \rangle$ to Positive Normal Form

Replace all operators with equivalent conflict-free operators. Convert all conditions to negation normal form (NNF). **while** any condition contains a negative literal  $\neg v$ :

Let v be a variable which occurs negatively in a condition.  $V := V \cup \{\hat{v}\}$  for some new propositional state variable  $\hat{v}$ 

$$I(\hat{v}) := \begin{cases} \mathbf{F} & \text{if } I(v) = \mathbf{T} \\ \mathbf{T} & \text{if } I(v) = \mathbf{F} \end{cases}$$

Replace the effect v by  $(v \land \neg \hat{v})$  in all operators  $o \in O$ . Replace the effect  $\neg v$  by  $(\neg v \land \hat{v})$  in all operators  $o \in O$ . Replace  $\neg v$  by  $\hat{v}$  in all conditions.

Convert all operators  $o \in O$  to flat operators.

Here, all conditions refers to all operator preconditions, operator effect conditions and the goal.

B5. Positive Normal Form and STRIPS

Positive Normal Form

### Why Positive Normal Form is Interesting

In the absence of conditional effects, positive normal form allows us to distinguish good and bad effects easily:

- Effects that make state variables true (add effects) are good.
- ► Effects that make state variables false (delete effects) are bad.

This is particularly useful for planning algorithms based on delete relaxation, which we will study in Part D.

(Why restriction "in the absence of conditional effects"?)

B5. Positive Normal Form and STRIPS

#### STRIPS

# STRIPS Operators and Planning Tasks

#### Definition (STRIPS Operator)

An operator o of a prop. planning task is a STRIPS operator if

- pre(o) is a conjunction of state variables, and
- *eff*(*o*) is a conflict-free conjunction of atomic effects.

#### Definition (STRIPS Planning Task)

A propositional planning task  $\langle V, I, O, \gamma \rangle$  is a STRIPS planning task if all operators  $o \in O$  are STRIPS operators and  $\gamma$  is a conjunction of state variables.

Note: STRIPS operators are conflict-free and flat.

STRIPS is a special case of positive normal form.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 2, 2023

22 / 27

B5. Positive Normal Form and STRIPS

STRIPS

#### STRIPS Operators: Remarks

► Every STRIPS operator is of the form

$$\langle v_1 \wedge \cdots \wedge v_n, \ell_1 \wedge \cdots \wedge \ell_m \rangle$$

where  $v_i$  are state variables and  $\ell_i$  are atomic effects.

- ► Often, STRIPS operators *o* are described via three sets of state variables:
  - $\triangleright$  the preconditions (state variables occurring in pre(o))
  - ▶ the add effects (state variables occurring positively in eff(o))
  - ▶ the delete effects (state variables occurring negatively in eff(o))
- ▶ Definitions of STRIPS in the literature often do not require conflict-freeness. But it is easy to achieve and makes many things simpler.
- ► There exists a variant called STRIPS with negation where negative literals are also allowed in conditions.

B5. Positive Normal Form and STRIPS

STRIPS

# Why STRIPS is Interesting

- ► STRIPS is particularly simple, yet expressive enough to capture general planning tasks.
- ► In particular, STRIPS planning is no easier than planning in general (as we will see in Chapter B6).
- Many algorithms in the planning literature are only presented for STRIPS planning tasks (generalization is often, but not always, obvious).

B5. Positive Normal Form and STRIPS STRIPS

#### Transformation to STRIPS

- ▶ Not every operator is equivalent to a STRIPS operator.
- ► However, each operator can be transformed into a set of STRIPS operators whose "combination" is equivalent to the original operator. (How?)
- ► However, this transformation may exponentially increase the number of operators. There are planning tasks for which such a blow-up is unavoidable.
- ➤ There are polynomial transformations of propositional planning tasks to STRIPS, but these do not lead to isomorphic transition systems (auxiliary states are needed). (They are, however, equivalent in a weaker sense.)

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 2, 2023

25 / 27

B5. Positive Normal Form and STRIPS

Summan

# Summary

- ► A positive task helps distinguish good and bad effects.

  The notion of positive tasks only exists for propositional tasks.
- A positive task with flat operators is in positive normal form.
- ► STRIPS is even more restrictive than positive normal form, forbidding complex preconditions and conditional effects.
- ▶ Both forms are expressive enough to capture general propositional planning tasks.
- ► Transformation to positive normal form is possible with polynomial size increase.
- ▶ Isomorphic transformations of propositional planning tasks to STRIPS can increase the number of operators exponentially; non-isomorphic polynomial transformations exist.
