Content of this Course

Planning and Optimization

Devising a Symbolic Search Algorithm

- ▶ We now put the pieces together to build a symbolic search algorithm for propositional planning tasks.
- ▶ use BDDs as a black box data structure:
 - care about provided operations and their time complexity
 - ▶ do not care about their internal implementation
- ▶ Efficient implementations are available as libraries, e.g.:
 - ► CUDD, a high-performance BDD library
 - ► libbdd, shipped with Ubuntu Linux

M. Helmert, G. Röger (Universität Basel)

Basic BDD Operations

BDD Operations: Preliminaries

- ► All BDDs work on a fixed and totally ordered set of propositional variables.
- ► Complexity of operations given in terms of:
 - ▶ k. the number of BDD variables
 - |B|, the number of nodes in the BDD B

M. Helmert, G. Röger (Universität Basel)

C7. Symbolic Search: Full Algorithm

Basic BDD Operations

BDD Operations (1)

BDD operations: logical/set atoms

- bdd-fullset(): build BDD representing all assignments
 - ▶ in logic: ⊤
 - ightharpoonup time complexity: O(1)
- ▶ bdd-emptyset(): build BDD representing ∅
 - ▶ in logic: ⊥
 - ightharpoonup time complexity: O(1)
- **b** bdd-atom(v): build BDD representing $\{s \mid s(v) = T\}$
 - ▶ in logic: v
 - ▶ time complexity: O(1)

C7. Symbolic Search: Full Algorithm

Basic BDD Operations

BDD Operations (2)

BDD operations: logical/set connectives

- **b** bdd-complement(B): build BDD representing $\overline{r(B)}$
 - ▶ in logic: $\neg \varphi$
 - ▶ time complexity: $O(\|B\|)$
- ▶ bdd-union(B, B'): build BDD representing $r(B) \cup r(B')$
 - ▶ in logic: $(\varphi \lor \psi)$
 - ▶ time complexity: $O(\|B\| \cdot \|B'\|)$
- ▶ bdd-intersection(B, B'): build BDD representing $r(B) \cap r(B')$
 - ▶ in logic: $(\varphi \wedge \psi)$

M. Helmert, G. Röger (Universität Basel)

▶ time complexity: $O(\|B\| \cdot \|B'\|)$

M. Helmert, G. Röger (Universität Basel) Planning and Optimization October 16, 2023

Planning and Optimization

October 16, 2023

Basic BDD Operations

BDD Operations (3)

BDD operations: Boolean tests

▶ bdd-includes(B, I): return **true** iff $I \in r(B)$

ightharpoonup in logic: $I \models \varphi$?

 \triangleright time complexity: O(k)

b bdd-equals(B, B'): return **true** iff r(B) = r(B')

▶ in logic: $\varphi \equiv \psi$?

 \triangleright time complexity: O(1) (due to canonical representation)

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

C7. Symbolic Search: Full Algorithm

Basic BDD Operations

Conditioning: Formulas

The last two basic BDD operations are a bit more unusual and require some preliminary remarks.

Conditioning a variable v in a formula φ to T or F, written $\varphi[T/v]$ or $\varphi[F/v]$, means restricting v to a particular truth value:

Examples:

- $(A \land (B \lor \neg C))[\mathbf{T}/B] = (A \land (\top \lor \neg C)) \equiv A$
- $(A \land (B \lor \neg C))[\mathbf{F}/B] = (A \land (\bot \lor \neg C)) \equiv A \land \neg C$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

10 / 45

C7. Symbolic Search: Full Algorithm

Basic BDD Operations

Conditioning: Sets of Assignments

We can define the same operation for sets of assignments S: S[F/v] and S[T/v] restrict S to elements with the given value for v and remove v from the domain of definition:

Example:

$$S = \{ \{ A \mapsto \mathbf{F}, B \mapsto \mathbf{F}, C \mapsto \mathbf{F} \}, \\ \{ A \mapsto \mathbf{T}, B \mapsto \mathbf{T}, C \mapsto \mathbf{F} \}, \\ \{ A \mapsto \mathbf{T}, B \mapsto \mathbf{T}, C \mapsto \mathbf{T} \} \}$$

$$\rightsquigarrow S[\mathbf{T}/B] = \{ \{ A \mapsto \mathbf{T}, C \mapsto \mathbf{F} \}, \\ \{ A \mapsto \mathbf{T}, C \mapsto \mathbf{T} \} \}$$

C7. Symbolic Search: Full Algorithm

Basic BDD Operations

Forgetting

Forgetting (a.k.a. existential abstraction) is similar to conditioning: we allow either truth value for v and remove the variable.

We write this as $\exists v \varphi$ (for formulas) and $\exists v S$ (for sets).

Formally:

- $ightharpoonup \exists v \, S = S[\mathbf{T}/v] \cup S[\mathbf{F}/v]$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

Basic BDD Operations

Forgetting: Example

Examples:

►
$$S = \{\{A \mapsto \mathbf{F}, B \mapsto \mathbf{F}, C \mapsto \mathbf{F}\}, \{A \mapsto \mathbf{T}, B \mapsto \mathbf{T}, C \mapsto \mathbf{F}\}, \{A \mapsto \mathbf{T}, B \mapsto \mathbf{T}, C \mapsto \mathbf{T}\}\}$$
 $\Rightarrow \exists B S = \{\{A \mapsto \mathbf{F}, C \mapsto \mathbf{F}\}, \{A \mapsto \mathbf{T}, C \mapsto \mathbf{F}\}, \{A \mapsto \mathbf{T}, C \mapsto \mathbf{T}\}\}$
 $\Rightarrow \exists C S = \{\{A \mapsto \mathbf{F}, B \mapsto \mathbf{F}\}, \{A \mapsto \mathbf{T}, B \mapsto \mathbf{T}\}\}$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

BDD Operations (4)

C7. Symbolic Search: Full Algorithm

BDD operations: conditioning and forgetting

- ▶ bdd-condition(B, v, t) where $t \in \{T, F\}$: build BDD representing r(B)[t/v]
 - ▶ in logic: $\varphi[t/v]$
 - ▶ time complexity: $O(\|B\|)$
- ▶ bdd-forget(*B*, *v*):

build BDD representing $\exists v \ r(B)$

- ▶ in logic: $\exists v \varphi$ (= $\varphi[\mathbf{T}/v] \lor \varphi[\mathbf{F}/v]$)
- ▶ time complexity: $O(\|B\|^2)$

Formulas and Singletons

C7.2 Formulas and Singletons

C7. Symbolic Search: Full Algorithm

Formulas and Singletons

Basic BDD Operations

Formulas to BDDs

- With the logical/set operations, we can convert propositional formulas φ into BDDs representing the models of φ .
- \blacktriangleright We denote this computation with bdd-formula(φ).
- Each individual logical connective takes polynomial time, but converting a full formula of length n can take $O(2^n)$ time. (How is this possible?)

Planning and Optimization October 16, 2023 15

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

Formulas and Singletons

Singleton BDDs

- We can convert a single truth assignment I into a BDD representing {I} by computing the conjunction of all literals true in I (using bdd-atom, bdd-complement and bdd-intersection).
- ▶ We denote this computation with bdd-singleton(/).
- ▶ When done in the correct order, this takes time O(k).

Renaming

C7. Symbolic Search: Full Algorithm

Renaming

Renaming

We will need to support one final operation on formulas: renaming.

Renaming X to Y in formula φ , written $\varphi[X \to Y]$, means replacing all occurrences of X by Y in φ .

We require that Y is not present in φ initially.

Example:

$$ightharpoonup \varphi = (A \wedge (B \vee \neg C))$$

$$\rightsquigarrow \varphi[A \to D] = (D \land (B \lor \neg C))$$

C7. Symbolic Search: Full Algorithm

Renaming

How Hard Can That Be?

- ► For formulas, renaming is a simple (linear-time) operation.
- ▶ For a BDD B, it is equally simple $(O(\|B\|))$ when renaming between variables that are adjacent in the variable order.
- ▶ In general, it requires $O(\|B\|^2)$, using the equivalence $\varphi[X \to Y] \equiv \exists X (\varphi \land (X \leftrightarrow Y))$

Symbolic Breadth-first Search

C7. Symbolic Search: Full Algorithm

Symbolic Breadth-first Search

Planning Task State Variables vs. BDD Variables

Consider propositional planning task $\langle V, I, O, \gamma \rangle$ with states S.

In symbolic planning, we have two BDD variables v and v' for every state variable $v \in V$ of the planning task.

- use unprimed variables v to describe sets of states: $\{s \in S \mid \text{some property}\}$
- use combinations of unprimed and primed variables v, v' to describe sets of state pairs: {⟨s, s'⟩ | some property}

How to do this?

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

29 / 45

C7. Symbolic Search: Full Algorithm

The apply Function (1)

We need an operation that

- ▶ for a set of states reached (given as a BDD)
- and a set of operators O
- computes the set of states (as a BDD) that result from applying some operator $o \in O$ in some state $s \in reached$.

We have seen something similar already. . .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

C7. Symbolic Search: Full Algorithm

Symbolic Breadth-first Search

Translating Operators into Formulas

Definition (Operators in Propositional Logic)

Let o be an operator and V a set of state variables.

Define $\tau_V(o) := pre(o) \land \bigwedge_{v \in V} (regr(v, eff(o)) \leftrightarrow v')$.

States that o is applicable and describes how

- \triangleright the new value of v, represented by v',
- ▶ must relate to the old state, described by variables V.

C7. Symbolic Search: Full Algorithm

Symbolic Breadth-first Search

The apply Function (2)

- ▶ The formula $\tau_V(o)$ describes all transitions $s \xrightarrow{o} s'$
 - induced by a single operator o
 - \triangleright in terms of variables \lor describing s
 - \triangleright and variables V' describing s'.
- ► The formula $\bigvee_{o \in O} \tau_V(o)$ describes state transitions by any operator in O.
- We can translate this formula to a BDD (over variables $V \cup V'$) with bdd-formula.
- ► The resulting BDD is called the transition relation of the planning task, written as $T_V(O)$.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

The apply Function (3)

Using the transition relation, we can compute *apply*(*reached*, *O*) as follows:

```
The apply function

def apply(reached, O):

B := T_V(O)
B := bdd\text{-}intersection(B, reached)

for each v \in V:

B := bdd\text{-}forget(B, v)

for each v \in V:

B := bdd\text{-}rename(B, v', v)

return B
```

M. Helmert, G. Röger (Universität Basel)

The *apply* Function (3)

Using the transition relation, we can compute *apply*(*reached*, *O*) as follows:

```
The apply function

def apply(reached, O):

B := T_V(O)
B := bdd-intersection(B, reached)

for each v \in V:

B := bdd-forget(B, v)

for each v \in V:

B := bdd-rename(B, v', v)

return B
```

This describes the set of state pairs $\langle s, s' \rangle$ where s' is a successor of s and $s \in reached$ in terms of variables $V \cup V'$.

C7. Symbolic Search: Full Algorithm

Symbolic Breadth-first Search

The apply Function (3)

Using the transition relation, we can compute *apply*(*reached*, *O*) as follows:

```
The apply function

def apply(reached, O):

B := T_V(O)
B := bdd\text{-intersection}(B, reached)

for each v \in V:

B := bdd\text{-forget}(B, v)

for each v \in V:

B := bdd\text{-rename}(B, v', v)

return B
```

This describes the set of states s' which are successors of some state $s \in reached$ in terms of variables V'.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

Symbolic Breadth-first Search

The apply Function (3)

Using the transition relation, we can compute *apply*(*reached*, *O*) as follows:

```
The apply function

def apply(reached, O):

B := T_V(O)
B := bdd-intersection(B, reached)

for each v \in V:

B := bdd-forget(B, v)

for each v \in V:

B := bdd-rename(B, v', v)

return B
```

This describes the set of states s' which are successors of some state $s \in reached$ in terms of variables V.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

October 16, 2023

37 / 45

C7. Symbolic Search: Full Algorithm

C7.5 Discussion

C7. Symbolic Search: Full Algorithm

Symbolic Breadth-first Search

The apply Function (3)

Using the transition relation, we can compute *apply*(*reached*, *O*) as follows:

```
The apply function
\mathbf{def} \ \mathsf{apply}(\mathit{reached}, \ O) :
B := \mathit{T}_V(O)
B := \mathit{bdd-intersection}(B, \mathit{reached})
\mathbf{for} \ \mathsf{each} \ v \in V :
B := \mathit{bdd-forget}(B, v)
\mathbf{for} \ \mathsf{each} \ v \in V :
B := \mathit{bdd-rename}(B, v', v)
\mathbf{return} \ B
```

Thus, *apply* indeed computes the set of successors of *reached* using operators *O*.

C7. Symbolic Search: Full Algorithm

Discussion

Discussion

- ► This completes the discussion of a (basic) symbolic search algorithm for classical planning.
- We ignored the aspect of solution extraction.
 This needs some extra work, but is not a major challenge.
- ► In practice, some steps can be performed slightly more efficiently, but these are comparatively minor details.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

Variable Orders

For good performance, we need a good variable ordering.

▶ Variables that refer to the same state variable before and after operator application (v and v') should be neighbors in the transition relation BDD.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 16, 2023

C7. Symbolic Search: Full Algorithm Extensions

C7.6 Summary

Symbolic search can be extended to...

regression and bidirectional search: this is very easy and often effective

uniform-cost search: requires some work, but not too difficult in principle

heuristic search: requires a heuristic representable as a BDD; has not really been shown to outperform blind symbolic search

Planning and Optimization

Summary

- ► Symbolic search operates on sets of states instead of individual states as in explicit-state search.
- ▶ State sets and transition relations can be represented as BDDs.
- ▶ Based on this, we can implement a blind breadth-first search in an efficient way.
- ► A good variable ordering is crucial for performance.
