D3. Delete Relaxation: Finding Relaxed Plans

Greedy Algorithm

## The Story So Far

- A general way to come up with heuristics is to solve a simplified version of the real problem.
- delete relaxation: given a task in positive normal form, discard all delete effects
  - relaxation lemma: solutions for a state s also work for any dominating state s'
  - ightharpoonup monotonicity lemma: s[o] dominates s

Greedy Algorith

D3. Delete Relaxation: Finding Relaxed Plans

## Correctness of the Greedy Algorithm

The algorithm is sound:

- ▶ If it returns a plan, this is indeed a correct solution.
- ▶ If it returns "unsolvable", the task is indeed unsolvable
  - ightharpoonup Upon termination, there clearly is no relaxed plan from s.
  - By iterated application of the monotonicity lemma, s dominates I.
  - ▶ By the relaxation lemma, there is no solution from *I*.

What about completeness (termination) and runtime?

- **Each** iteration of the loop adds at least one atom to on(s).
- ightharpoonup This guarantees termination after at most |V| iterations.
- ► Thus, the algorithm can clearly be implemented to run in polynomial time.
  - ▶ A good implementation runs in  $O(\|\Pi\|)$ .

D3. Delete Relaxation: Finding Relaxed Plans

Greedy Algorithm

## Greedy Algorithm for Relaxed Planning Tasks

The relaxation and monotonicity lemmas suggest the following algorithm for solving relaxed planning tasks:

```
Greedy Planning Algorithm for \langle V, I, O^+, \gamma \rangle s := I \pi^+ := \langle \rangle loop forever:

if s \models \gamma:

return \pi^+
else if there is an operator o^+ \in O^+ applicable in s with s\llbracket o^+ \rrbracket \neq s:

Append such an operator o^+ to \pi^+.

s := s\llbracket o^+ \rrbracket
else:

return unsolvable
```

Greedy Algorith

# Using the Greedy Algorithm as a Heuristic

We can apply the greedy algorithm within heuristic search for a general (non-relaxed) planning task:

- ▶ When evaluating a state *s* in progression search, solve relaxation of planning task with initial state *s*.
- When evaluating a subgoal  $\varphi$  in regression search, solve relaxation of planning task with goal  $\varphi$ .
- $\triangleright$  Set h(s) to the cost of the generated relaxed plan.
  - in general not well-defined: different choices of  $o^+$  in the algorithm lead to different h(s)

Is this admissible/safe/goal-aware/consistent?

D3. Delete Relaxation: Finding Relaxed Plans

Properties of the Greedy Algorithm as a Heuristic

Is this an admissible heuristic?

- Yes if the relaxed plans are optimal (due to the plan preservation corollary).
- ► However, usually they are not, because the greedy algorithm can make poor choices of which operators to apply.

How hard is it to find optimal relaxed plans?

Optimal Relaxed Plans

## Optimal Relaxation Heuristic

Definition (h<sup>+</sup> heuristic)

Let  $\Pi = \langle V, I, O, \gamma \rangle$  be a planning task in positive normal form with states S.

The optimal delete relaxation heuristic  $h^+$  for  $\Pi$ 

is the function  $h: S \to \mathbb{R}_0^+ \cup \{\infty\}$ 

where h(s) is the cost of an optimal relaxed plan for s,

i.e., of an optimal plan for  $\Pi_s^+ = \langle V, s, O^+, \gamma \rangle$ .

(can analogously define a heuristic for regression)

admissible/safe/goal-aware/consistent?

### The Set Cover Problem

D3. Delete Relaxation: Finding Relaxed Plans

Can we compute  $h^+$  efficiently?

This question is related to the following problem:

Problem (Set Cover)

Given: a finite set U, a collection of subsets  $C = \{C_1, \ldots, C_n\}$ with  $C_i \subseteq U$  for all  $i \in \{1, ..., n\}$ , and a natural number K. Question: Is there a set cover of size at most K, i.e.,

a subcollection  $S = \{S_1, \dots, S_m\} \subseteq C$ with  $S_1 \cup \cdots \cup S_m = U$  and  $m \leq K$ ?

The following is a classical result from complexity theory:

Theorem (Karp 1972)

The set cover problem is NP-complete.

D3. Delete Relaxation: Finding Relaxed Plans

Optimal Relaxed Plans

## Complexity of Optimal Relaxed Planning (1)

#### Theorem (Complexity of Optimal Relaxed Planning)

The BCPLANEX problem restricted to delete-relaxed planning tasks is NP-complete.

#### Proof.

For membership in NP, guess a plan and verify.

It is sufficient to check plans of length at most |V| where V is the set of state variables, so this can be done in nondeterministic polynomial time.

For hardness, we reduce from the set cover problem.

D3. Delete Relaxation: Finding Relaxed Plans

Summar

# D3.3 Summary

D3. Delete Relaxation: Finding Relaxed Plans

Optimal Relaxed Plans

## Complexity of Optimal Relaxed Planning (2)

#### Proof (continued).

Given a set cover instance  $\langle U, C, K \rangle$ , we generate the following relaxed planning task  $\Pi^+ = \langle V, I, O^+, \gamma \rangle$ :

- ightharpoonup V = U
- $I = \{ v \mapsto \mathbf{F} \mid v \in V \}$
- $ightharpoonup \gamma = \bigwedge_{v \in U} v$

If S is a set cover, the corresponding operators form a plan. Conversely, each plan induces a set cover by taking the subsets corresponding to the operators. There exists a plan of cost at most K iff there exists a set cover of size K.

Moreover,  $\Pi^+$  can be generated from the set cover instance in polynomial time, so this is a polynomial reduction.

D3. Delete Relaxation: Finding Relaxed Plans

Summar

## Summary

- ▶ Because of their monotonicity property, delete-relaxed tasks can be solved in polynomial time by a greedy algorithm.
- ► However, the solution quality of this algorithm is poor.
- ► For an informative heuristic, we would ideally want to find optimal relaxed plans.
- The solution cost of an optimal relaxed plan is the estimate of the  $h^+$  heuristic.
- ► However, the bounded-cost plan existence problem for relaxed planning tasks is NP-complete.
