Pattern Collections

- ► The space requirements for a pattern database grow exponentially with the number of state variables in the pattern.
- ► This places severe limits on the usefulness of single PDB heuristics h^P for larger planning task.
- ▶ To overcome this limitation, planners using pattern databases work with collections of multiple patterns.
- \triangleright When using two patterns P_1 and P_2 , it is always possible to use the maximum of h^{P_1} and h^{P_2} as an admissible and consistent heuristic estimate.
- ► However, when possible, it is much preferable to use the sum of h^{P_1} and h^{P_2} as a heuristic estimate, since $h^{P_1} + h^{P_2} > \max\{h^{P_1}, h^{P_2}\}.$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 13, 2023

Proof.

If there exists no such operator, then no label of $\mathcal{T}(\Pi)$ affects both $\mathcal{T}(\Pi)^{\pi_{P_i}}$ and $\mathcal{T}(\Pi)^{\pi_{P_j}}$ for $i \neq j$. By the theorem on affecting

Criterion for Additive Patterns

Theorem (Additive Pattern Sets)

If there exists no operator that has an effect

transition labels, this means that any two projections π_{P_i} and π_{P_i} are orthogonal. The claim follows with the theorem on additivity

for orthogonal abstractions.

A pattern set $\{P_1, \dots, P_k\}$ which satisfies the criterion of the theorem is called an additive pattern set or additive set.

Let P_1, \ldots, P_k be disjoint patterns for an FDR planning task Π .

on a variable $v_i \in P_i$ and on a variable $v_i \in P_i$ for some $i \neq j$,

then $\sum_{i=1}^{k} h^{P_i}$ is an admissible and consistent heuristic for Π .

E7. Pattern Databases: Multiple Patterns

Additivity & the Canonical Heuristic

Finding Additive Pattern Sets

The theorem on additive pattern sets gives us a simple criterion to decide which pattern heuristics can be admissibly added.

Given a pattern collection \mathcal{C} (i.e., a set of patterns), we can use this information as follows:

- **1** Build the compatibility graph for C.
 - \triangleright Vertices correspond to patterns $P \in \mathcal{C}$.
 - ► There is an edge between two vertices iff no operator affects both incident patterns.
- 2 Compute all maximal cliques of the graph. These correspond to maximal additive subsets of C.
 - Computing large cliques is an NP-hard problem. and a graph can have exponentially many maximal cliques.
 - ► However, there are output-polynomial algorithms for finding all maximal cliques (Tomita, Tanaka & Takahashi, 2004) which have led to good results in practice.

E7. Pattern Databases: Multiple Patterns

Additivity & the Canonical Heuristic

Finding Additive Pattern Sets: Example

Example

Consider a planning task with state variables $V = \{v_1, \dots, v_5\}$ and the pattern collection $C = \{P_1, \dots, P_5\}$ with $P_1 = \{v_1, v_2, v_3\}$, $P_2 = \{v_1, v_2\}, P_3 = \{v_3\}, P_4 = \{v_4\} \text{ and } P_5 = \{v_5\}.$

There are operators affecting each individual variable. variables v_1 and v_2 , variables v_3 and v_4 and variables v_3 and v_5 . What are the maximal cliques in the compatibility graph for C?

Answer: $\{P_1\}, \{P_2, P_3\}, \{P_2, P_4, P_5\}$

Additivity & the Canonical Heuristic

The Canonical Heuristic Function

Definition (Canonical Heuristic Function)

Let C be a pattern collection for an FDR planning task.

The canonical heuristic $h^{\mathcal{C}}$ for pattern collection \mathcal{C} is defined as

$$h^{\mathcal{C}}(s) = \max_{\mathcal{D} \in cliques(\mathcal{C})} \sum_{P \in \mathcal{D}} h^{P}(s),$$

where cliques(C) is the set of all maximal cliques in the compatibility graph for C.

For all choices of C, heuristic h^{C} is admissible and consistent.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 13, 2023

9 / 30

How Good is the Canonical Heuristic Function?

- The canonical heuristic function is the best possible admissible heuristic we can derive from C using our additivity criterion.
- Even better heuristic estimates can be obtained from projection heuristics using a more general additivity criterion based on an idea called cost partitioning.
- → We will return to this topic in Part G.

E7. Pattern Databases: Multiple Patterns

Additivity & the Canonical Heuristic

Canonical Heuristic Function: Example

Example

Consider a planning task with state variables $V = \{v_1, \dots, v_5\}$ and the pattern collection $C = \{P_1, \dots, P_5\}$ with $P_1 = \{v_1, v_2, v_3\}$, $P_2 = \{v_1, v_2\}$, $P_3 = \{v_3\}$, $P_4 = \{v_4\}$ and $P_5 = \{v_5\}$.

There are operators affecting each individual variable, an operator that affects v_1 and v_2 and an operator that affects v_3 , v_4 and v_5 .

What are the maximal cliques in the compatibility graph for \mathcal{C} ?

Answer: $\{P_1\}, \{P_2, P_3\}, \{P_2, P_4, P_5\}$

What is the canonical heuristic function $h^{\mathcal{C}}$?

Answer:

$$\begin{split} h^{\mathcal{C}} &= \max \left\{ h^{P_1}, h^{P_2} + h^{P_3}, h^{P_2} + h^{P_4} + h^{P_5} \right\} \\ &= \max \left\{ h^{\{v_1, v_2, v_3\}}, h^{\{v_1, v_2\}} + h^{\{v_3\}}, h^{\{v_1, v_2\}} + h^{\{v_4\}} + h^{\{v_5\}} \right\} \end{split}$$

E7. Pattern Databases: Multiple Patterns

Dominated Additive Sets

E7.2 Dominated Additive Sets

Dominated Additive Sets

Computing $h^{\mathcal{C}}$ Efficiently: Motivation

Consider

 $h^{\mathcal{C}} = \max\{h^{\{v_1,v_2,v_3\}}, h^{\{v_1,v_2\}} + h^{\{v_3\}}, h^{\{v_1,v_2\}} + h^{\{v_4\}} + h^{\{v_5\}}\}.$

- ▶ We need to evaluate this expression for every search node.
- ▶ It is thus worth to spend some effort in precomputations to make the evaluation more efficient.

A naive implementation requires 5 PDB lookups (one for each pattern) and maximizes over 3 additive sets.

Can we do better?

E7. Pattern Databases: Multiple Patterns

Dominated Additive Sets

Dominated Sum Theorem

Theorem (Dominated Sum)

Let $\{P_1, \ldots, P_k\}$ be an additive pattern set for an FDR planning task Π , and let P be a pattern with $P_i \subseteq P$ for all $i \in \{1, \ldots, k\}$. Then $\sum_{i=1}^k h^{P_i} \leq h^P$.

Proof.

Because $P_i \subseteq P$, all projections π_{P_i} are coarsenings of the projection π_P . Let $\mathcal{T}' := \mathcal{T}(\Pi)^{\pi_P}$.

We can view each h^{P_i} as an abstraction heuristic for solving \mathcal{T}' .

By the argumentation of the previous theorem, $\{P_1,\ldots,P_k\}$ is an additive pattern set and hence $\sum_{i=1}^k h^{P_i}$ is an admissible heuristic for solving \mathcal{T}' . Hence, $\sum_{i=1}^k h^{P_i}$ is bounded by the optimal goal distances in \mathcal{T}' , which implies $\sum_{i=1}^k h^{P_i} \leq h^P$.

E7. Pattern Databases: Multiple Patterns

Dominated Additive Sets

Dominated Sum Corollary

Corollary (Dominated Sum)

Let $\{P_1, \ldots, P_n\}$ and $\{Q_1, \ldots, Q_m\}$ be additive pattern sets of an FDR planning task such that each pattern P_i is a subset of some pattern Q_j (not necessarily proper). Then $\sum_{i=1}^n h^{P_i} \leq \sum_{i=1}^m h^{Q_j}$.

Proof.

$$\sum_{i=1}^{n} h^{P_i} \stackrel{(1)}{\leq} \sum_{j=1}^{m} \sum_{P_i \subset Q_i} h^{P_i} \stackrel{(2)}{\leq} \sum_{j=1}^{m} h^{Q_j},$$

where (1) holds because each P_i is contained in some Q_j and (2) follows from the dominated sum theorem.

E7. Pattern Databases: Multiple Patterns

Dominated Additive Sets

Dominance Pruning

- We can use the dominated sum corollary to simplify the representation of $h^{\mathcal{C}}$: sums that are dominated by other sums can be pruned.
- ▶ The dominance test can be performed in polynomial time.

Example

M. Helmert, G. Röger (Universität Basel)

$$\begin{split} & \max \big\{ h^{\{v_1, v_2, v_3\}}, h^{\{v_1, v_2\}} + h^{\{v_3\}}, h^{\{v_1, v_2\}} + h^{\{v_4\}} + h^{\{v_5\}} \big\} \\ &= \max \big\{ h^{\{v_1, v_2, v_3\}}, h^{\{v_1, v_2\}} + h^{\{v_4\}} + h^{\{v_5\}} \big\} \end{split}$$

→ number of PDB lookups reduced from 5 to 4; number of additive sets reduced from 3 to 2

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Redundant Patterns

- ► The previous example shows that sometimes, not all patterns in a pattern collection are useful.
 - ▶ Pattern $\{v_3\}$ could be removed because it does not affect the heuristic value.
- ► In this section, we will show that certain patterns are never useful and should thus never be considered.
- ► Knowing about such redundant patterns is useful for algorithms that try to find good patterns automatically.
- → It allows us to focus on the useful ones.

Planning and Optimization

November 13, 2023

10 / 20

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Non-Goal Patterns

Theorem (Non-Goal Patterns are Trivial)

E7.3 Redundant Patterns

Let Π be a SAS⁺ planning task, and let P be a pattern for Π such that no variable in P is mentioned in the goal formula of Π . Then $h^P(s) = 0$ for all states s.

Proof.

All states in the abstraction are goal states.

Patterns with no goal variables are redundant.

They should not be included in a pattern collection.

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Causal Graphs: Motivation

- ► For more interesting notions of redundancy, we need to introduce causal graphs.
- ► Causal graphs describe the dependency structure between the state variables of a planning task.
- ► Causal graphs are a general tool for analyzing planning tasks.
- ▶ They are used in many contexts besides abstraction heuristics.

Redundant Patterns

Causal Graphs

Definition (Causal Graph)

Let $\Pi = \langle V, I, O, \gamma \rangle$ be an FDR planning task.

The causal graph of Π , written $CG(\Pi)$, is the directed graph whose vertices are the state variables V and which has an arc $\langle u, v \rangle$ iff $u \neq v$ and there exists an operator $o \in O$ such that:

- u appears anywhere in o (in precondition, effect conditions or atomic effects), and
- v is modified by an effect of o.

Idea: an arc $\langle u, v \rangle$ in the causal graph indicates that variable u is in some way relevant for modifying the value of v

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Causally Relevant Variables

Definition (Causally Relevant)

Let $\Pi = \langle V, I, O, \gamma \rangle$ be an FDR planning task, and let $P \subseteq V$ be a pattern for Π .

We say that $v \in P$ is causally relevant for P if $CG(\Pi)$, restricted to the variables of P, contains a directed path from v to a variable $v' \in P$ that is mentioned in the goal formula γ .

Note: The definition implies that variables in P mentioned in the goal are always causally relevant for P.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 13, 2023

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Causally Irrelevant Variables are Useless

Theorem (Causally Irrelevant Variables are Useless)

Let $P \subseteq V$ be a pattern for an FDR planning task Π , and let $P' \subseteq P$ consist of all variables that are causally relevant for P.

Then $h^{P}(s) = h^{P'}(s)$ for all states s.

 \rightsquigarrow Patterns P where not all variables are causally relevant are redundant. The smaller subpattern P' should be used instead.

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Causally Irrelevant Variables are Useless: Proof

Proof Sketch.

 (\geq) : holds because π_P is a refinement of $\pi_{P'}$

(\leq): Obvious if $h^{P'}(s) = \infty$; else, consider an optimal abstract plan $\langle o_1, \ldots, o_n \rangle$ for $\pi_{P'}(s)$ in $\mathcal{T}(\Pi)^{\pi_{P'}}$.

W.l.o.g., each o_i modifies some variable in P'. (Other o_i are redundant and can be omitted.)

Because P' includes all variables causally relevant for P, no variable in $P \setminus P'$ is mentioned in any o_i or in the goal.

Then the same abstract plan also is a solution for $\pi_P(s)$ in $\mathcal{T}(\Pi)^{\pi_P}$. Hence, the optimal solution cost under abstraction π_P is no larger than under $\pi_{P'}$.

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Causally Connected Patterns

Definition (Causally Connected)

Let $\Pi = \langle V, I, O, \gamma \rangle$ be an FDR planning task, and let $P \subseteq V$ be a pattern for Π .

We say that P is causally connected if the subgraph of $CG(\Pi)$ induced by P is weakly connected (i.e., contains a path from every vertex to every other vertex, ignoring arc directions).

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 13, 2023

25 / 30

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Disconnected Patterns are Decomposable

Theorem (Causally Disconnected Patterns are Decomposable)

Let $P \subseteq V$ be a pattern for a SAS⁺ planning task Π that is not causally connected, and let P_1 , P_2 be a partition of P into non-empty subsets such that $CG(\Pi)$ contains no arc between the two sets.

Then $h^{P}(s) = h^{P_1}(s) + h^{P_2}(s)$ for all states s.

 \sim Causally disconnected patterns P are redundant. The smaller subpatterns P_1 and P_2 should be used instead.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 13, 2023

.

E7. Pattern Databases: Multiple Patterns

Redundant Patterns

Disconnected Patterns are Decomposable: Proof

Proof Sketch.

 (\geq) : There is no arc between P_1 and P_2 in the causal graph, and thus there is no operator that affects both patterns.

Therefore, they are additive, and $h^P \ge h^{P_1} + h^{P_2}$ follows from the dominated sum theorem.

(\leq): Obvious if $h^{P_1}(s) = \infty$ or $h^{P_2}(s) = \infty$. Else, consider optimal abstract plans ρ_1 for $\mathcal{T}(\Pi)^{\pi_{P_1}}$ and ρ_2 for $\mathcal{T}(\Pi)^{\pi_{P_2}}$.

Because the variables of the two projections do not interact, concatenating the two plans yields an abstract plan for $\mathcal{T}(\Pi)^{\pi_P}$.

Hence, the optimal solution cost under abstraction π_P is at most the sum of costs of ρ_1 and ρ_2 , and thus $h^P < h^{P_1} + h^{P_2}$.

E7. Pattern Databases: Multiple Patterns

Summary (1)

► When faced with multiple PDB heuristics (a pattern collection), we want to admissibly add their values where possible, and maximize where addition is inadmissible.

- ► A set of patterns is additive if each operator affects (i.e., assigns to a variable from) at most one pattern in the set.
- ► The canonical heuristic function is the best possible additive/maximizing combination for a given pattern collection given this additivity criterion.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 13, 2023

29 / 30

E7. Pattern Databases: Multiple Patterns

Summary (2)

Not all patterns need to be considered, as some are redundant:

- ▶ Patterns should include a goal variable (else $h^P = 0$).
- ► Patterns should only include causally relevant variables (others can be dropped without affecting the heuristic value).
- ▶ Patterns should be causally connected (disconnected patterns can be split into smaller subpatterns at no loss).
