# Content of the Course

# The Domination Lemma

# On-Set and Dominating States

## Definition (On-Set)

The **on-set** of an interpretation  $s$  is the set of propositional variables that are true in  $s$ , i.e.,  $on(s) = s^{-1}(\{\mathbf{T}\})$ .

↪ for **states** of propositional planning tasks:  
states can be viewed as **sets** of (true) state variables

## Definition (Dominate)

An interpretation  $s'$  **dominates** an interpretation  $s$  if  $on(s) \subseteq on(s')$ .

↪ all state variables true in  $s$  are also true in  $s'$

# Domination Lemma (1)

## Lemma (Domination)

*Let  $s$  and  $s'$  be interpretations of a set of propositional variables  $V$ , and let  $\chi$  be a propositional formula over  $V$  which does not contain negation symbols.*

*If  $s \models \chi$  and  $s'$  dominates  $s$ , then  $s' \models \chi$ .*

## Proof.

Proof by induction over the structure of  $\chi$ .

- Base case  $\chi = \top$ : then  $s' \models \top$ .
- Base case  $\chi = \perp$ : then  $s \not\models \perp$ .

...

## Domination Lemma (2)

### Proof (continued).

- Base case  $\chi = v \in V$ : if  $s \models v$ , then  $v \in on(s)$ .  
With  $on(s) \subseteq on(s')$ , we get  $v \in on(s')$  and hence  $s' \models v$ .
- Inductive case  $\chi = \chi_1 \wedge \chi_2$ : by induction hypothesis, our claim holds for the proper subformulas  $\chi_1$  and  $\chi_2$  of  $\chi$ .

$$\begin{aligned} s \models \chi &\implies s \models \chi_1 \wedge \chi_2 \\ &\implies s \models \chi_1 \text{ and } s \models \chi_2 \\ \text{I.H. (twice)} &\implies s' \models \chi_1 \text{ and } s' \models \chi_2 \\ &\implies s' \models \chi_1 \wedge \chi_2 \\ &\implies s' \models \chi. \end{aligned}$$

- Inductive case  $\chi = \chi_1 \vee \chi_2$ : analogous

# The Relaxation Lemma

## Add Sets and Delete Sets

### Definition (Add Set and Delete Set for an Effect)

Consider a propositional planning task with state variables  $V$ . Let  $e$  be an effect over  $V$ , and let  $s$  be a state over  $V$ .

The **add set** of  $e$  in  $s$ , written  $addset(e, s)$ , and the **delete set** of  $e$  in  $s$ , written  $delset(e, s)$ , are defined as the following sets of state variables:

$$addset(e, s) = \{v \in V \mid s \models effcond(v, e)\}$$

$$delset(e, s) = \{v \in V \mid s \models effcond(\neg v, e)\}$$

**Note:** For all states  $s$  and operators  $o$  applicable in  $s$ , we have  $on(s[o]) = (on(s) \setminus delset(eff(o), s)) \cup addset(eff(o), s)$ .

# Relaxation Lemma

For this and the following chapters on delete relaxation, we assume implicitly that we are working with **propositional planning tasks in positive normal form**.

## Lemma (Relaxation)

*Let  $s$  be a state, and let  $s'$  be a state that dominates  $s$ .*

- 1 If  $o$  is an operator applicable in  $s$ , then  $o^+$  is applicable in  $s'$  and  $s'[[o^+]]$  dominates  $s[[o]]$ .*
- 2 If  $\pi$  is an operator sequence applicable in  $s$ , then  $\pi^+$  is applicable in  $s'$  and  $s'[[\pi^+]]$  dominates  $s[[\pi]]$ .*
- 3 If additionally  $\pi$  leads to a goal state from state  $s$ , then  $\pi^+$  leads to a goal state from state  $s'$ .*

# Proof of Relaxation Lemma (1)

## Proof.

Let  $V$  be the set of state variables.

**Part 1:** Because  $o$  is applicable in  $s$ , we have  $s \models pre(o)$ .

Because  $pre(o)$  is negation-free and  $s'$  dominates  $s$ , we get  $s' \models pre(o)$  from the domination lemma.

Because  $pre(o^+) = pre(o)$ , this shows that  $o^+$  is applicable in  $s'$ .

...

## Proof of Relaxation Lemma (2)

### Proof (continued).

To prove that  $s' \llbracket o^+ \rrbracket$  dominates  $s \llbracket o \rrbracket$ ,  
we first compare the relevant add sets:

$$\begin{aligned} \text{addset}(\text{eff}(o), s) &= \{v \in V \mid s \models \text{effcond}(v, \text{eff}(o))\} \\ &= \{v \in V \mid s \models \text{effcond}(v, \text{eff}(o^+))\} & (1) \\ &\subseteq \{v \in V \mid s' \models \text{effcond}(v, \text{eff}(o^+))\} & (2) \\ &= \text{addset}(\text{eff}(o^+), s'), \end{aligned}$$

where (1) uses  $\text{effcond}(v, \text{eff}(o)) \equiv \text{effcond}(v, \text{eff}(o^+))$   
and (2) uses the dominance lemma (note that effect conditions  
are negation-free for operators in positive normal form). ...

## Proof of Relaxation Lemma (3)

Proof (continued).

We then get:

$$\begin{aligned} on(s[o]) &= (on(s) \setminus delset(eff(o), s)) \cup addset(eff(o), s) \\ &\subseteq on(s) \cup addset(eff(o), s) \\ &\subseteq on(s') \cup addset(eff(o^+), s') \\ &= on(s'[o^+]), \end{aligned}$$

and thus  $s'[o^+]$  dominates  $s[o]$ .

This concludes the proof of Part 1. ...

## Proof of Relaxation Lemma (4)

### Proof (continued).

Part 2: by induction over  $n = |\pi|$

Base case:  $\pi = \langle \rangle$

The empty plan is trivially applicable in  $s'$ , and  $s'[\langle \rangle^+] = s'$  dominates  $s[\langle \rangle] = s$  by prerequisite.

Inductive case:  $\pi = \langle o_1, \dots, o_{n+1} \rangle$

By the induction hypothesis,  $\langle o_1^+, \dots, o_n^+ \rangle$  is applicable in  $s'$ , and  $t' = s'[\langle o_1^+, \dots, o_n^+ \rangle]$  dominates  $t = s[\langle o_1, \dots, o_n \rangle]$ .

Also,  $o_{n+1}$  is applicable in  $t$ .

Using Part 1,  $o_{n+1}^+$  is applicable in  $t'$  and  $s'[\pi^+] = t'[\langle o_{n+1}^+ \rangle]$  dominates  $s[\pi] = t[\langle o_{n+1} \rangle]$ .

This concludes the proof of Part 2.

...

## Proof of Relaxation Lemma (5)

### Proof (continued).

**Part 3:** Let  $\gamma$  be the goal formula.

From Part 2, we obtain that  $t' = s'[\llbracket \pi^+ \rrbracket]$  dominates  $t = s[\llbracket \pi \rrbracket]$ .  
By prerequisite,  $t$  is a goal state and hence  $t \models \gamma$ .

Because the task is in positive normal form,  $\gamma$  is negation-free,  
and hence  $t' \models \gamma$  because of the domination lemma.

Therefore,  $t'$  is a goal state. □

# Consequences

## Consequences of the Relaxation Lemma

- The relaxation lemma is the main technical result that we will use to study delete relaxation.
- Next, we show two further properties of delete relaxation that will be useful for us.
- They are direct consequences of the relaxation lemma.

# Consequences of the Relaxation Lemma (1)

## Corollary (Relaxation Preserves Plans and Leads to Dominance)

*Let  $\pi$  be an operator sequence that is applicable in state  $s$ .*

*Then  $\pi^+$  is applicable in  $s$  and  $s[\pi^+]$  dominates  $s[\pi]$ .*

*If  $\pi$  is a plan for  $\Pi$ , then  $\pi^+$  is a plan for  $\Pi^+$ .*

## Proof.

Apply relaxation lemma with  $s' = s$ . □

- ↪ Relaxations of plans are relaxed plans.
- ↪ Delete relaxation is no harder to solve than original task.
- ↪ Optimal relaxed plans are never more expensive than optimal plans for original tasks.

## Consequences of the Relaxation Lemma (2)

### Corollary (Relaxation Preserves Dominance)

*Let  $s$  be a state, let  $s'$  be a state that dominates  $s$ , and let  $\pi^+$  be a relaxed operator sequence applicable in  $s$ . Then  $\pi^+$  is applicable in  $s'$  and  $s'[\pi^+]$  dominates  $s[\pi^+]$ .*

### Proof.

Apply relaxation lemma with  $\pi^+$  for  $\pi$ , noting that  $(\pi^+)^+ = \pi^+$ . □

- ↪ If there is a relaxed plan starting from state  $s$ , the same plan can be used starting from a dominating state  $s'$ .
- ↪ Dominating states are always “better” in relaxed tasks.

# Monotonicity

# Monotonicity of Relaxed Planning Tasks

## Lemma (Monotonicity)

*Let  $s$  be a state in which relaxed operator  $o^+$  is applicable.  
Then  $s \llbracket o^+ \rrbracket$  dominates  $s$ .*

## Proof.

Since relaxed operators only have positive effects,  
we have  $on(s) \subseteq on(s) \cup addset(eff(o^+), s) = on(s \llbracket o^+ \rrbracket)$ . □

↪ Together with our previous results, this means that  
making a transition in a relaxed planning task **never** hurts.

# Finding Relaxed Plans

Using the theory we developed, we are now ready to study the problem of **finding plans** for **relaxed planning tasks**.

↪ next chapter

# Summary

# Summary

- With positive normal form, having more true variables is good.
- We can formalize this as **dominance** between states.
- It follows that delete relaxation is a **simplification**:  
it is never harder to solve a relaxed task than the original one.
- In delete-relaxed tasks, applying an operator always takes us to a dominating state and therefore never hurts.
