#### Transition Systems

#### Reminder from Chapter B1:

Definition (Transition System)

A transition system is a 6-tuple  $\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle$  where

- S is a finite set of states.
- L is a finite set of (transition) labels.
- $ightharpoonup c: L \to \mathbb{R}_0^+$  is a label cost function,
- $ightharpoonup T \subset S \times L \times S$  is the transition relation,
- $ightharpoonup s_0 \in S$  is the initial state, and
- $ightharpoonup S_{\star} \subseteq S$  is the set of goal states.

We say that  $\mathcal{T}$  has the transition  $\langle s, \ell, s' \rangle$  if  $\langle s, \ell, s' \rangle \in \mathcal{T}$ .

We also write this as  $s \xrightarrow{\ell} s'$ , or  $s \to s'$  when not interested in  $\ell$ .

Note: Transition systems are also called state spaces.

E4. Abstractions: Formal Definition and Heuristics

Reminder: Transition Systems

### Transition Systems: Example

Note: To reduce clutter, our figures often omit arc labels and costs and collapse transitions between identical states. However, these are important for the formal definition of the transition system.

Reminder: Transition Systems

#### Mapping Planning Tasks to Transition Systems

#### Reminder from Chapters B3 and E1:

Definition (Transition System Induced by a Planning Task)

The planning task  $\Pi = \langle V, I, O, \gamma \rangle$  induces the transition system  $\mathcal{T}(\Pi) = \langle S, L, c, T, s_0, S_{\star} \rangle$ , where

- ▶ S is the set of all states over state variables V.
- L is the set of operators O.
- ightharpoonup c(o) = cost(o) for all operators  $o \in O$ ,
- $T = \{\langle s, o, s' \rangle \mid s \in S, o \text{ applicable in } s, s' = s[o]\},$
- $\triangleright$   $s_0 = I$ , and

(same definition for propositional and finite-domain representation)

E4. Abstractions: Formal Definition and Heuristics

Reminder: Transition Systems

#### Tasks in Finite-Domain Representation

#### Notes:

- ► We will focus on planning tasks in finite-domain representation (FDR) while studying abstractions.
- ▶ All concepts apply equally to propositional planning tasks.
- ▶ However, FDR tasks are almost always used by algorithms in this context because they tend to have fewer useless (physically impossible) states.
- Useless states can hurt the efficiency of abstraction-based algorithms.

Reminder: Transition Systems

#### Example Task: One Package, Two Trucks

Example (One Package, Two Trucks)

Consider the following FDR planning task  $\langle V, I, O, \gamma \rangle$ :

- $\triangleright$   $V = \{p, t_A, t_B\}$  with
  - $b dom(p) = \{L, R, A, B\}$
- $I = \{ p \mapsto L, t_A \mapsto R, t_B \mapsto R \}$
- - $\cup \{ \text{move}_{i,j,j'} \mid i \in \{A,B\}, j,j' \in \{L,R\}, j \neq j' \}, \text{ where }$
  - ightharpoonup pickup<sub>i,j</sub> =  $\langle t_i = j \land p = j, p := i, 1 \rangle$

  - ightharpoonup move $_{i,j,j'}=\langle t_i=j,t_i:=j',1\rangle$
- $ightharpoonup \gamma = (p = R)$

E4. Abstractions: Formal Definition and Heuristics

Abstraction

#### Abstractions

#### Definition (Abstraction)

Let  $\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle$  be a transition system.

An abstraction (also: abstraction function, abstraction mapping) of  $\mathcal{T}$  is a function  $\alpha: S \to S^{\alpha}$  defined on the states of  $\mathcal{T}$ , where  $S^{\alpha}$  is an arbitrary set.

Without loss of generality, we require that  $\boldsymbol{\alpha}$  is surjective.

Intuition:  $\alpha$  maps the states of  $\mathcal T$  to another (usually smaller) abstract state space.

Abstractions

### Abstract Transition System

#### Definition (Abstract Transition System)

Let  $\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle$  be a transition system, and let  $\alpha : S \to S^{\alpha}$  be an abstraction of  $\mathcal{T}$ .

The abstract transition system induced by  $\alpha$ , in symbols  $\mathcal{T}^{\alpha}$ , is the transition system  $\mathcal{T}^{\alpha} = \langle S^{\alpha}, L, c, T^{\alpha}, s_{0}^{\alpha}, S_{\star}^{\alpha} \rangle$  defined by:

- $T^{\alpha} = \{ \langle \alpha(s), \ell, \alpha(t) \rangle \mid \langle s, \ell, t \rangle \in T \}$
- $ightharpoonup s_0^{\alpha} = \alpha(s_0)$

Abstractions

### Concrete and Abstract State Space

Let  $\mathcal{T}$  be a transition system and  $\alpha$  be an abstraction of  $\mathcal{T}$ .

- $ightharpoonup \mathcal{T}$  is called the concrete transition system.
- $ightharpoonup \mathcal{T}^{\alpha}$  is called the abstract transition system.
- ➤ Similarly: concrete/abstract state space, concrete/abstract transition, etc.

#### M. Helmert, G. Röger (Universität Basel)

#### Strict Homomorphisms

- ightharpoonup The abstraction mapping  $\alpha$  that transforms  $\mathcal{T}$  to  $\mathcal{T}^{\alpha}$ is also called a strict homomorphism from  $\mathcal{T}$  to  $\mathcal{T}^{\alpha}$ .
- ► Roughly speaking, in mathematics a homomorphism is a property-preserving mapping between structures.
- A strict homomorphism is one where no additional features are introduced. A non-strict homomorphism in planning would mean that the abstract transition system may include additional transitions and goal states not induced by  $\alpha$ .

E4. Abstractions: Formal Definition and Heuristics

Abstraction Heuristics

#### **Abstraction Heuristics**

#### Definition (Abstraction Heuristic)

Let  $\alpha: S \to S^{\alpha}$  be an abstraction of a transition system  $\mathcal{T}$ .

The abstraction heuristic induced by  $\alpha$ , written  $h^{\alpha}$ , is the heuristic function  $h^{\alpha}: S \to \mathbb{R}_0^+ \cup \{\infty\}$  defined as

$$h^{\alpha}(s) = h^*_{\mathcal{T}^{\alpha}}(\alpha(s))$$
 for all  $s \in S$ ,

where  $h_{\mathcal{T}^{\alpha}}^*$  denotes the goal distance function in  $\mathcal{T}^{\alpha}$ .

#### Notes:

- $h^{\alpha}(s) = \infty$  if no goal state of  $\mathcal{T}^{\alpha}$  is reachable from  $\alpha(s)$
- $\triangleright$  We also apply abstraction terminology to planning tasks  $\Pi$ , which stand for their induced transition systems. For example, an abstraction of  $\Pi$  is an abstraction of  $\mathcal{T}(\Pi)$ .

E4. Abstractions: Formal Definition and Heuristics Abstraction Heuristics Abstraction Heuristics: Example  $h^{\alpha}(\{p \mapsto \mathsf{L}, t_{\mathsf{A}} \mapsto \mathsf{R}, t_{\mathsf{B}} \mapsto \mathsf{R}\}) = 3$ M. Helmert, G. Röger (Universität Basel) November 6, 2024

### Consistency of Abstraction Heuristics (1)

#### Theorem (Consistency and Admissibility of $h^{\alpha}$ )

Let  $\alpha$  be an abstraction of a transition system  $\mathcal{T}$ . Then  $h^{\alpha}$  is safe, goal-aware, admissible and consistent.

#### Proof.

We prove goal-awareness and consistency; the other properties follow from these two.

Let 
$$\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle$$
.  
Let  $\mathcal{T}^{\alpha} = \langle S^{\alpha}, L, c, T^{\alpha}, s_0^{\alpha}, S_{\star}^{\alpha} \rangle$ .

Goal-awareness: We need to show that  $h^{\alpha}(s) = 0$  for all  $s \in S_{\star}$ , so let  $s \in S_{\star}$ . Then  $\alpha(s) \in S_{\star}^{\alpha}$  by the definition of abstract transition systems, and hence  $h^{\alpha}(s) = h^*_{T\alpha}(\alpha(s)) = 0$ .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 6, 2024

E4. Abstractions: Formal Definition and Heuristics

Coarsenings and Refinements

# E4.4 Coarsenings and Refinements

#### Consistency of Abstraction Heuristics (2)

#### Proof (continued).

Consistency: Consider any state transition  $s \xrightarrow{\ell} t$  of  $\mathcal{T}$ .

We need to show  $h^{\alpha}(s) < c(\ell) + h^{\alpha}(t)$ .

By the definition of  $\mathcal{T}^{\alpha}$ , we get  $\alpha(s) \xrightarrow{\ell} \alpha(t) \in \mathcal{T}^{\alpha}$ . Hence,  $\alpha(t)$  is a successor of  $\alpha(s)$  in  $\mathcal{T}^{\alpha}$  via the label  $\ell$ .

We get:

$$h^{lpha}(s) = h_{\mathcal{T}^{lpha}}^*(lpha(s)) \ \leq c(\ell) + h_{\mathcal{T}^{lpha}}^*(lpha(t)) \ = c(\ell) + h^{lpha}(t),$$

where the inequality holds because perfect goal distances  $h_{\mathcal{T}^{lpha}}^{*}$ are consistent in  $\mathcal{T}^{\alpha}$ .

(The shortest path from  $\alpha(s)$  to the goal in  $\mathcal{T}^{\alpha}$  cannot be longer than the shortest path from  $\alpha(s)$  to the goal via  $\alpha(t)$ .)

M. Helmert, G. Röger (Universität Basel)

November 6, 2024

E4. Abstractions: Formal Definition and Heuristics

Coarsenings and Refinements

#### Abstractions of Abstractions

Since abstractions map transition systems to transition systems, they are composable:

- ▶ Using a first abstraction  $\alpha: S \to S'$ , map  $\mathcal{T}$  to  $\mathcal{T}^{\alpha}$ .
- ▶ Using a second abstraction  $\beta: S' \to S''$ , map  $\mathcal{T}^{\alpha}$  to  $(\mathcal{T}^{\alpha})^{\beta}$ .

The result is the same as directly using the abstraction ( $\beta \circ \alpha$ ):

- ▶ Let  $\gamma: S \to S''$  be defined as  $\gamma(s) = (\beta \circ \alpha)(s) = \beta(\alpha(s))$ .
- ightharpoonup Then  $\mathcal{T}^{\gamma} = (\mathcal{T}^{\alpha})^{\beta}$ .

Coarsenings and Refinements

#### Coarsenings and Refinements

#### Definition (Coarsening and Refinement)

Let  $\alpha$  and  $\gamma$  be abstractions of the same transition system such that  $\gamma = \beta \circ \alpha$  for some function  $\beta$ .

Then  $\gamma$  is called a coarsening of  $\alpha$ and  $\alpha$  is called a refinement of  $\gamma$ .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 6, 2024

E4. Abstractions: Formal Definition and Heuristics

Coarsenings and Refinements

#### Heuristic Quality of Refinements

#### Theorem (Heuristic Quality of Refinements)

Let  $\alpha$  and  $\gamma$  be abstractions of the same transition system such that  $\alpha$  is a refinement of  $\gamma$ .

Then  $h^{\alpha}$  dominates  $h^{\gamma}$ .

In other words,  $h^{\gamma}(s) \leq h^{\alpha}(s) \leq h^{*}(s)$  for all states s.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

November 6, 2024

E4. Abstractions: Formal Definition and Heuristics

Coarsenings and Refinements

#### Heuristic Quality of Refinements: Proof

#### Proof.

Since  $\alpha$  is a refinement of  $\gamma$ , there exists a function  $\beta$  with  $\gamma = \beta \circ \alpha$ .

For all states s of  $\Pi$ , we get:

$$h^{\gamma}(s) = h^*_{\mathcal{T}^{\gamma}}(\gamma(s))$$

$$= h^*_{\mathcal{T}^{\gamma}}(\beta(\alpha(s)))$$

$$= h^*_{\mathcal{T}^{\alpha}}(\alpha(s))$$

$$\leq h^*_{\mathcal{T}^{\alpha}}(\alpha(s))$$

$$= h^{\alpha}(s),$$

where the inequality holds because  $h^{eta}_{\mathcal{T}^{lpha}}$  is an admissible heuristic in the transition system  $\mathcal{T}^{\alpha}$ .

Summary

ightharpoonup An abstraction is a function  $\alpha$  that maps the states Sof a transition system to another (usually smaller) set  $S^{\alpha}$ .

- ightharpoonup This induces an abstract transition system  $\mathcal{T}^{\alpha}$ , which behaves like the original transition system  $\mathcal{T}$  except that states mapped to the same abstract state cannot be distinguished.
- Abstractions  $\alpha$  induce abstraction heuristics  $h^{\alpha}$ :  $h^{\alpha}(s)$ is the goal distance of  $\alpha(s)$  in the abstract transition system.
- ► Abstraction heuristics are safe, goal-aware, admissible and consistent.
- ▶ Abstractions can be composed, leading to coarser vs. finer abstractions. Heuristics for finer abstractions dominate those for coarser ones.
