Reminder: Generic Algorithm Template

```
Generic Merge & Shrink Algorithm for planning task Π
  F := F(\Pi)
 while |F| > 1:
           select type \in \{merge, shrink\}
           if type = merge:
                     select \mathcal{T}_1, \mathcal{T}_2 \in F
                     F := (F \setminus \{\mathcal{T}_1, \mathcal{T}_2\}) \cup \{\mathcal{T}_1 \otimes \mathcal{T}_2\}
           if type = shrink:
                     select \mathcal{T} \in \mathcal{F}
                     choose an abstraction mapping \beta on \mathcal{T}
                     F := (F \setminus \{\mathcal{T}\}) \cup \{\mathcal{T}^{\beta}\}
  return the remaining factor \mathcal{T}^{\alpha} in F
```

Remaining Question:

► Which abstractions to select for merging?

merge strategy

Merge Strategies

Classes of Merge Strategies

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

We can distinguish two major types of merge strategies:

precomputed merge strategies fix a unique merge order up-front.

One-time effort but cannot react to other transformations applied to the factors.

stateless merge strategies only consider the current FTS and decide what factors to merge.

Typically computing a score for each pair of factors and naturally non-linear; easy to implement but cannot capture dependencies between more than two factors.

Hybrid strategies combine ideas from precomputed and stateless strategies.

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Linear vs. Non-linear Merge Strategies

Linear Merge Strategy

In each iteration after the first, choose the abstraction computed in the previous iteration as \mathcal{T}_1 .

Rationale: only maintains one "complex" abstraction at a time

- Fully defined by an ordering of atomic projections/variables.
- ► Each merge-and-shrink heuristic computed with a non-linear merge strategy can also be computed with a linear merge strategy.
- ► However, linear merging can require a super-polynomial blow-up of the final representation size.
- ▶ Recent research turned from linear to non-linear strategies, also because better label reduction techniques (later in this chapter) enabled a more efficient computation.

M. Helmert, G. Röger (Universität Basel)

November 20, 2024

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Merge Strategies

Example Linear Precomputed Merge Strategy

Idea: Use similar causal graph criteria as for growing patterns.

Example: Strategy of h_{HHH}

h_{HHH}: Ordering of atomic projections

- ► Start with a goal variable.
- ► Add variables that appear in preconditions of operators affecting previous variables.
- ▶ If that is not possible, add a goal variable.

Rationale: increases h quickly

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Merge Strategies

Example Non-linear Precomputed Merge Strategy

Idea: Build clusters of variables with strong interactions and first merge variables within each cluster.

Example: MIASM ("maximum intermediate abstraction size minimizing merging strategy")

MIASM strategy

- Measure interaction by ratio of unnecessary states in the merged system (= states not traversed by any abstract plan).
- ▶ Best-first search to identify interesting variable sets.
- Disjoint variable sets chosen by a greedy algorithm for maximum weighted set packing.

Rationale: increase power of pruning (cf. next chapter)

M. Helmert, G. Röger (Universität Basel)

es E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Merge Strategies

Example Non-linear Stateless Merge Strategy

Idea: Preferrably merge transition systems that must synchronize on labels that occur close to a goal state.

Example: DFP (named after Dräger, Finkbeiner and Podelski)

DFP strategy

- ▶ $labelrank(\ell, \mathcal{T}) = min\{h^*(t) \mid \langle s, \ell, t \rangle \text{ transition in } \mathcal{T}\}$
- ► $score(\mathcal{T}, \mathcal{T}') = min\{max\{labelrank(\ell, \mathcal{T}), labelrank(\ell, \mathcal{T}')\} \mid \ell \text{ label in } \mathcal{T} \text{ and } \mathcal{T}'\}$
- ▶ Select two transition systems with minimum score.

Rationale: abstraction fine-grained in the goal region, which is likely to be searched by A^* .

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Merge Strategies

Example Hybrid Merge Strategy

Idea: first combine the variables within each strongly connected component of the causal graph.

Example: SCC framework

SCC strategy

- ► Compute strongly connected components of causal graph
- Secondary strategies for order in which
 - ▶ the SCCs are considered (e.g. topologic order),
 - ▶ the factors within an SCC are merged, and
 - the resulting product systems are merged.

Rationale: reflect strong interactions of variables well

State of the art: SCC+DFP or a stateless MIASM variant

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Label Reduction: Motivation (2)

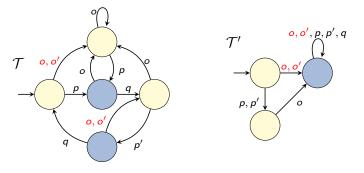

States s and t are not bisimilar due to labels p and p'. In \mathcal{T}' they label the same (parallel) transitions. If p and p' have the same cost, in such a situation there is no need for distinguishing them.

Idea: Replace p and p' with label p'' with same cost.

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Label Reduction: Motivation (1)

Whenever there is a transition with label o' there is also a transition with label o. If o' is not cheaper than o, we can always use the transition with o.

Idea: Replace o and o' with label o" with cost of o

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Label Reduction: Motivation (3)

Label reductions reduce the time and memory requirement for merge and shrink steps and enable coarser bisimulation abstractions.

When is label reduction a conservative transformation?

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

Label Reduction: Definition

Definition (Label Reduction)

Let F be a factored transition system with label set L and label cost function c. A label reduction $\langle \lambda, c' \rangle$ for F is given by a function $\lambda: L \to L'$, where L' is an arbitrary set of labels, and a label cost function c' on L' such that for all $\ell \in L$, $c'(\lambda(\ell)) < c(\ell)$.

For $\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle \in F$ the label-reduced transition system is $\mathcal{T}^{\langle \lambda, c' \rangle} = \langle S, L', c', \{ \langle s, \lambda(\ell), t \rangle \mid \langle s, \ell, t \rangle \in T \}, s_0, S_{\star} \rangle$.

The label-reduced FTS is $F^{\langle \lambda, c' \rangle} = \{ \mathcal{T}^{\langle \lambda, c' \rangle} \mid \mathcal{T} \in F \}.$

 $L' \cap L \neq \emptyset$ and L' = L are allowed.

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Label Reduction is Conservative

Theorem (Label Reduction is Safe)

Let F be a factored transition systems and $\langle \lambda, c' \rangle$ be a label-reduction for F.

The transformation $\langle F, id, \lambda, F^{\langle \lambda, c' \rangle} \rangle$ is conservative.

(Proof omitted.)

We can use label reduction as an additional possible step in merge-and-shrink.

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

More Terminology

Let F be a factored transition systems with labels L. Let $\ell, \ell' \in L$ be labels and let $T \in F$.

- ▶ Label ℓ is alive in F if all $\mathcal{T}' \in F$ have some transition labelled with ℓ . Otherwise, ℓ is dead.
- ▶ Label ℓ locally subsumes label ℓ' in \mathcal{T} if for all transitions $\langle s, \ell', t \rangle$ of \mathcal{T} there is also a transition $\langle s, \ell, t \rangle$ in \mathcal{T} .
- \blacktriangleright ℓ globally subsumes ℓ' if it locally subsumes ℓ' in all $\mathcal{T}' \in F$.
- \blacktriangleright ℓ and ℓ' are locally equivalent in \mathcal{T} if they label the same transitions in \mathcal{T} , i.e. ℓ locally subsumes ℓ' in \mathcal{T} and vice versa.
- \blacktriangleright ℓ and ℓ' are \mathcal{T} -combinable if they are locally equivalent in all transition systems $\mathcal{T}' \in F \setminus \{\mathcal{T}\}.$

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Exact Label Reduction

Theorem (Criteria for Exact Label Reduction)

Let F be a factored transition systems with cost function c and label set L that contains no dead labels.

Let $\langle \lambda, c' \rangle$ be a label-reduction for F such that λ combines labels ℓ_1 and ℓ_2 and leaves other labels unchanged. The transformation from F to $F^{(\lambda,c')}$ is exact iff $c(\ell_1)=c(\ell_2)$, $c'(\lambda(\ell))=c(\ell)$ for all $\ell \in L$. and

- \triangleright ℓ_1 globally subsumes ℓ_2 , or
- \triangleright ℓ_2 globally subsumes ℓ_1 , or
- \blacktriangleright ℓ_1 and ℓ_2 are \mathcal{T} -combinable for some $\mathcal{T} \in \mathcal{F}$.

(Proof omitted.)

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Computation of Exact Label Reduction (1)

- ▶ For given labels ℓ_1, ℓ_2 , the criteria can be tested in low-order polynomial time.
- Finding globally subsumed labels involves finding subset relationsships in a set family.
 - \rightsquigarrow no linear-time algorithms known
- ▶ The following algorithm exploits only *T*-combinability.

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Label Reduction

Computation of Exact Label Reduction (2)

 $eq_i := \text{set of label equivalence classes of } \mathcal{T}_i \in F$

Label-reduction based on \mathcal{T}_i -combinability

 $eq := \{ [\ell]_{\sim_c} \mid \ell \in L, \ell' \sim_c \ell'' \text{ iff } c(\ell') = c(\ell'') \}$

for j ∈ {1, . . . , |F|} \ {i}

Refine eq with eq_j

// two labels are in the same set of eq iff they have

// the same cost and are locally equivalent in all $\mathcal{T}_j \neq \mathcal{T}_i$.

 $\lambda = \mathsf{id}$

for $B \in eq$

 $\ell_{\mathsf{new}} := \mathsf{new} \; \mathsf{label}$

 $c'(\ell_{\sf new}) := {\sf cost} \ {\sf of} \ {\sf labels} \ {\sf in} \ {\it B}$

for $\ell \in B$

 $\lambda(\ell) = \ell_{\mathsf{new}}$

E12. Merge-and-Shrink: Merge Strategies and Label Reduction

Summary

- ► There is a wide range of merge strategies. We only covered some important ones.
- ► Label reduction is crucial for the performance of the merge-and-shrink algorithm, especially when using bisimilarity for shrinking.
