Introduction

Example Task (1)

Example (Example Task) SAS⁺ task $\Pi = \langle V, I, O, \gamma \rangle$ with $\blacktriangleright V = \{A, B, C\}$ with dom $(v) = \{0, 1, 2, 3, 4\}$ for all $v \in V$ $\blacktriangleright I = \{A \mapsto 0, B \mapsto 0, C \mapsto 0\}$ $\blacktriangleright O = \{inc_x^v \mid v \in V, x \in \{0, 1, 2\}\} \cup \{jump^v \mid v \in V\}$ $\vdash inc_x^v = \langle v = x, v := x + 1, 1 \rangle$ $\vdash jump^v = \langle \bigwedge_{v' \in V: v' \neq v} v' = 4, v := 3, 1 \rangle$ $\vdash \gamma = A = 3 \land B = 3 \land C = 3$ \vdash Each optimal plan consists of three increment operators for

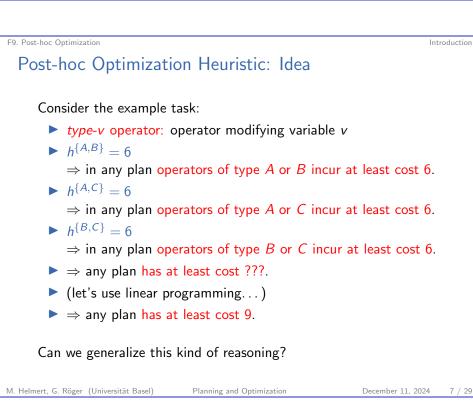

► Each optimal plan consists of three increment operators for each variable ~→ h*(I) = 9

Planning and Optimization

Each operator affects only one variable.

M. Helmert, G. Röger (Universität Basel)

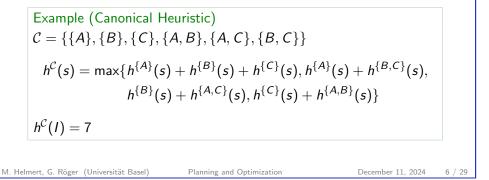

December 11, 2024 5 / 29

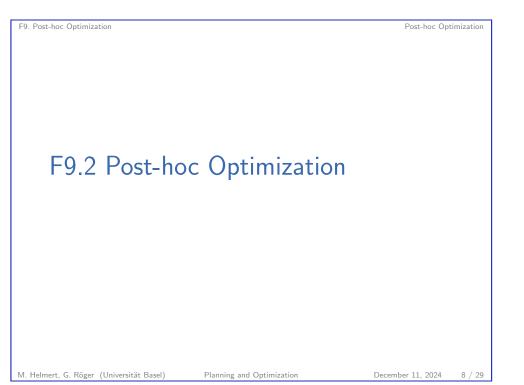

F9. Post-hoc Optimization

Example Task (2)

- In projections on single variables we can reach the goal with a jump operator: h^{A}(I) = h^{B}(I) = h^{C}(I) = 1.
- In projections on more variables, we need for each variable three applications of increment operators to reach the abstract goal from the abstract initial state: h^{A,B}(I) = h^{A,C}(I) = h^{B,C}(I) = 6

F9. Post-hoc Optimization

Post-hoc Optimization

M. Helmert, G. Röger (Universität Basel)

The heuristic that generalizes this kind of reasoning

can be computed for any kind of heuristic ...

... as long as we are able to determine relevance of operators

but for PhO to work well, it's important that the set of

Planning and Optimization

is the Post-hoc Optimization Heuristic (PhO)

▶ if in doubt, it's always safe to assume

an operator is relevant for a heuristic

relevant operators is as small as possible

Post-hoc Optimization

Operator Relevance in Abstractions

F9. Post-hoc Optimization

Definition (Reminder: Affecting Transition Labels) Let \mathcal{T} be a transition system, and let ℓ be one of its labels. We say that ℓ affects \mathcal{T} if \mathcal{T} has a transition $s \xrightarrow{\ell} t$ with $s \neq t$.

Definition (Operator Relevance in Abstractions) An operator o is relevant for an abstraction α if o affects \mathcal{T}^{α} .

We can efficiently determine operator relevance for abstractions.

P9. Post-hoc Optimization Linear Program (1) For a given set of abstractions $\{\alpha_1, ..., \alpha_n\}$, we construct a linear program: • variable X_o for each operator $o \in O$ • intuitively, X_o is cost incurred by operator o• abstraction heuristics are admissible $\sum_{o \in O} X_o \ge h^{\alpha}(s) \text{ for } \alpha \in \{\alpha_1, ..., \alpha_n\}$ • can tighten these constraints to $\sum_{o \in O:o \text{ relevant for } \alpha} X_o \ge h^{\alpha}(s) \text{ for } \alpha \in \{\alpha_1, ..., \alpha_n\}$ M. Helmert, G. Röger (Universitä Basel) Planing and Optimization Post-hoc Optimization

Linear Program (2) For set of abstractions $\{\alpha_1, \dots, \alpha_n\}$: Variables Non-negative variables X_o for all operators $o \in O$ Objective

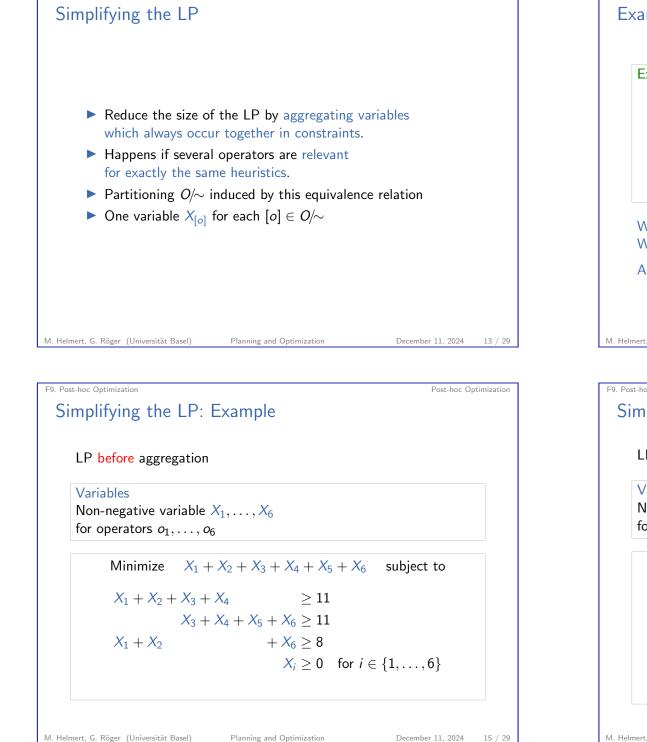

Minimize $\sum_{o \in O} X_o$

 $\sum_{o \in O: o \text{ relevant for } \alpha} X_o \ge h^{\alpha}(s) \quad \text{for } \alpha \in \{\alpha_1, \dots, \alpha_n\}$ $X_o \ge 0 \qquad \text{for all } o \in O$

Planning and Optimization

Subject to

F9. Post-hoc Optimization

F9. Post-hoc Optimization	
Example	

Post-hoc Optimization

- only operators o_3, o_4, o_5 and o_6 are relevant for h_2 and $h_2(s_0) = 11$
- only operators o₁, o₂ and o₆ are relevant for h₃ and h₃(s₀) = 8

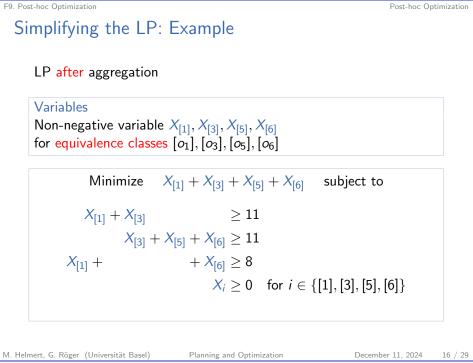

Which operators are relevant for exactly the same heuristics? What is the resulting partitioning?

Answer: $o_1 \sim o_2$ and $o_3 \sim o_4$ $\Rightarrow O/\!\!\sim = \{[o_1], [o_3], [o_5], [o_6]\}$

F9. Post-hoc Optimization

Post-hoc Optimization Heuristic: Admissibility

Theorem (Admissibility)

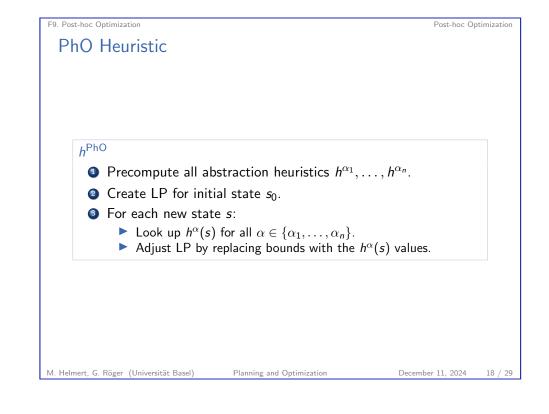

The post-hoc optimization heuristic is admissible.

Proof.

Let Π be a planning task and $\{\alpha_1, \ldots, \alpha_n\}$ be a set of abstractions. We show that there is a feasible variable assignment with objective value equal to the cost of an optimal plan.

Let π be an optimal plan for state *s* and let $cost_{\pi}(O')$ be the cost incurred by operators from $O' \subseteq O$ in π .

Setting each $X_{[o]}$ to $cost_{\pi}([o])$ is a feasible variable assignment: Constraints $X_{[o]} \ge 0$ are satisfied.

Post-hoc Optimization Heuristic: Admissibility

Theorem (Admissibility)

The post-hoc optimization heuristic is admissible.

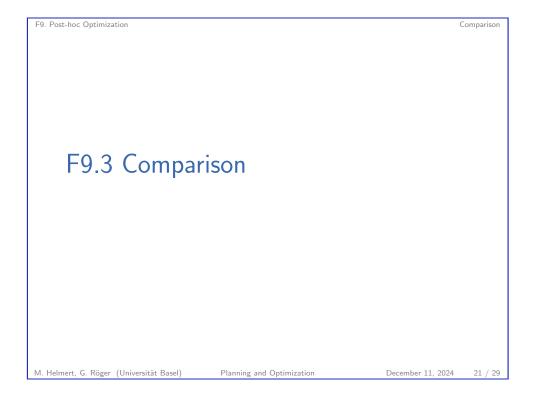

Proof (continued).

F9. Post-hoc Optimization

For each $\alpha \in {\alpha_1, ..., \alpha_n}$, π is a solution in the abstract transition system and the sum in the corresponding constraint equals the cost of the state-changing abstract state transitions (i.e.. not accounting for self-loops). As $h^{\alpha}(s)$ corresponds to the cost of an optimal solution in the abstraction, the inequality holds. For this assignment, the objective function has value $h^*(s)$

(cost of π), so the objective value of the LP is admissible.

Post-hoc Optimization

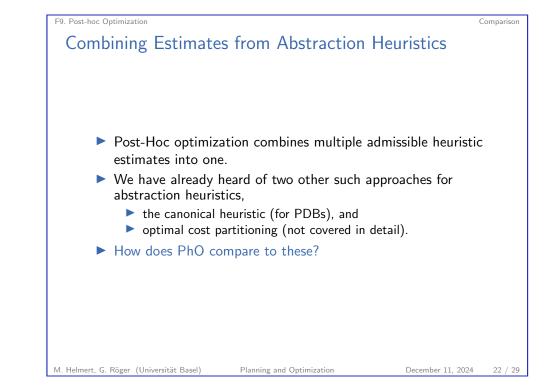

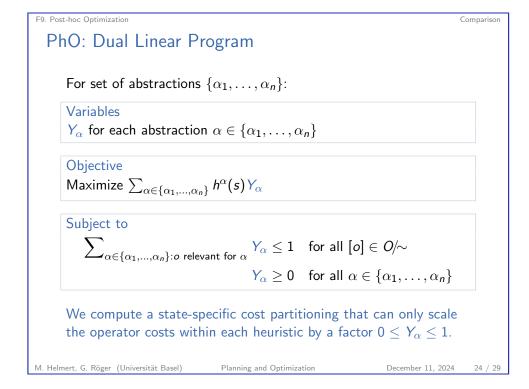

F9. Post-hoc Optimization

What about Optimal Cost Partitioning for Abstractions?

Optimal cost partitioning for abstractions...

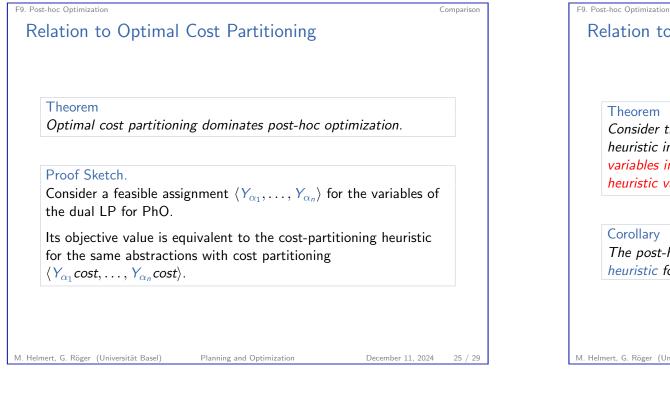

- ... uses a state-specific LP to find the best possible cost partitioning, and sums up the heuristic estimates.
- In the canonical heuristic, i.e. for the same pattern collection, it never gives lower estimates than h^C.
- ... is very expensive to compute (recomputing all abstract goal distances in every state).

F9. Post-hoc Optimization h^{PhO} vs $h^{\mathcal{C}}$

For the	canonical	heuristic,	we	need	to	find	all	maxim	al
cliques,	which is a	an NP-har	<mark>d</mark> pi	robler	n.				

- ► The post-hoc optimization heuristic dominates the canonical heuristic and can be computed in polynomial time.
- ▶ The post-hoc optimization heuristic solves an LP in each state.
- ▶ With post-hoc optimization, a large number of small patterns works well.

Relation to Canonical Heuristic

Consider the dual D of the LP solved by the post-hoc optimization heuristic in state s for a given set of abstractions. If we restrict the variables in D to integers, the objective value is the canonical heuristic value $h^{\mathcal{C}}(s)$.

The post-hoc optimization heuristic dominates the canonical heuristic for the same set of abstractions.
