Introduction

#### Reminder: Transition Normal Form

In this chapter, we consider SAS<sup>+</sup> tasks in transition normal form.

- ► A TNF operator mentions the same variables in the precondition and in the effect.
- ► A TNF goal specifies a value for every variable.

F12. Potential Heuristics Introduction

#### Idea

- ▶ Define simple numerical state features  $f_1, \ldots, f_n$ .
- Consider heuristics that are linear combinations of features:

$$h(s) = w_1 f_1(s) + \cdots + w_n f_n(s)$$

with weights (potentials)  $w_i \in \mathbb{R}$ 

▶ heuristic very fast to compute if feature values are

Potential Heuristics

#### Definition

#### Definition (Feature)

A (state) feature for a planning task is a numerical function defined on the states of the task:  $f: S \to \mathbb{R}$ .

#### Definition (Potential Heuristic)

A potential heuristic for a set of features  $\mathcal{F} = \{f_1, \dots, f_n\}$ is a heuristic function h defined as a linear combination of the features:

$$h(s) = w_1 f_1(s) + \cdots + w_n f_n(s)$$

with weights (potentials)  $w_i \in \mathbb{R}$ .

Many possibilities ⇒ need some restrictions

## Features for SAS<sup>+</sup> Planning Tasks

Which features are good for planning?

Atomic features test if some atom is true in a state:

Definition (Atomic Feature)

Let v = d be an atom of a FDR planning task.

The atomic feature  $f_{v=d}$  is defined as:

$$f_{v=d}(s) = [(v=d) \in s] = egin{cases} 1 & ext{if variable } v ext{ has value } d ext{ in state } s \ 0 & ext{otherwise} \end{cases}$$

Offer good tradeoff between computation time and guidance

F12. Potential Heuristics

Potential Heuristics

### **Example: Atomic Features**

#### Example

Consider a planning task  $\Pi$  with state variables  $v_1$  and  $v_2$  and  $dom(v_1) = dom(v_2) = \{d_1, d_2, d_3\}.$  The set

$$\mathcal{F} = \{ f_{\nu_i = d_i} \mid i \in \{1, 2\}, j \in \{1, 2, 3\} \}$$

is the set of atomic features of  $\Pi$  and the function

$$h(s) = 3f_{v_1=d_1} + 0.5f_{v_1=d_2} - 2f_{v_1=d_3} + 2.5f_{v_2=d_1}$$

is a potential heuristic for  $\mathcal{F}$ .

The heuristic estimate for a state  $s = \{v_1 \mapsto d_2, v_2 \mapsto d_1\}$  is

$$h(s) = 3 \cdot 0 + 0.5 \cdot 1 - 2 \cdot 0 + 2.5 \cdot 1 = 3.$$

Potential Heuristics

## Potentials for Optimal Planning

Which potentials are good for optimal planning and how can we compute them?

- ▶ We seek potentials for which *h* is admissible and well-informed ⇒ declarative approach to heuristic design
- ▶ We derive potentials for atomic features by solving an optimization problem

How to achieve this? Linear programming to the rescue!

#### Admissible and Consistent Potential Heuristics

We achieve admissibility through goal-awareness and consistency

Goal-awareness

$$\sum_{a \in \gamma} w_a = 0$$

#### Consistency

$$\sum_{a \in s} w_a - \sum_{a \in s'} w_a \le cost(o) \quad \text{for all transitions } s \xrightarrow{o} s'$$

One constraint transition per transition. Can we do this more compactly?

M. Helmert, G. Röger (Universität Basel)

F12. Potential Heuristics

Potential Heuristics

#### Admissible and Consistent Potential Heuristics

Consistency for a transition  $s \xrightarrow{o} s'$ 

$$\begin{aligned} cost(o) &\geq \sum_{a \in s} w_a - \sum_{a \in s'} w_a \\ &= \sum_a w_a [a \in s] - \sum_a w_a [a \in s'] \\ &= \sum_a w_a ([a \in s] - [a \in s']) \\ &= \sum_a w_a [a \in s \text{ but } a \notin s'] - \sum_a w_a [a \notin s \text{ but } a \in s'] \\ &= \sum_a w_a - \sum_{\substack{a \text{ consumed by } o \text{ by } o}} w_a \end{aligned}$$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

December 16, 2024

F12. Potential Heuristics Potential Heuristics

#### Admissible and Consistent Potential Heuristics

Goal-awareness and Consistency independent of s

Goal-awareness

$$\sum_{a \in \gamma} w_a = 0$$

Consistency

$$\sum_{\substack{a \text{ consumed} \\ \text{by } o}} w_a - \sum_{\substack{a \text{ produced} \\ \text{by } o}} w_a \leq cost(o) \quad \text{for all operators } o$$

F12. Potential Heuristics Potential Heuristics

#### Potential Heuristics

- ▶ All atomic potential heuristics that satisfy these constraints are admissible and consistent
- ► Furthermore, all admissible and consistent atomic potential heuristics satisfy these constraints

Constraints are a compact characterization of all admissible and consistent atomic potential heuristics.

LP can be used to find the best admissible and consistent potential heuristics by encoding a quality metric in the objective function

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

F12. Potential Heuristics

Potential Heuristics

Well-Informed Potential Heuristics

What do we mean by the best potential heuristic? Different possibilities, e.g., the potential heuristic that

- maximizes heuristic value of a given state s (e.g., initial state)
- maximizes average heuristic value of all states (including unreachable ones)
- maximizes average heuristic value of some sample states
- minimizes estimated search effort

M. Helmert, G. Röger (Universität Basel)

F12.3 Summary

F12. Potential Heuristics Potential Heuristics

#### Potential and Flow Heuristic

#### Theorem

For state s, let  $h^{\text{maxpot}}(s)$  denote the maximal heuristic value of all admissible and consistent atomic potential heuristics in s.

Then  $h^{\text{maxpot}}(s) = h^{\text{flow}}(s)$ .

Proof idea: compare dual of  $h^{flow}(s)$  LP to potential heuristic constraints optimized for state s.

If we optimize the potentials for a given state then for this state it equals the flow heuristic.

F12. Potential Heuristics

Summary

## Summary

- Potential heuristics are computed as a weighted sum of state features
- Admissibility and consistency can be encoded compactly in constraints
- ► With linear programming, we can efficiently compute the best potential heuristic wrt some objective
- Potential heuristics can be used as fast admissible approximations of  $h^{flow}$ .
