Countable Sets

B7. Sets: Countability

Comparing Cardinality

- ► Two sets A and B have the same cardinality if their elements can be paired (i.e. there is a bijection from A to B).
- ► Set *A* has a strictly smaller cardinality than set *B* if
 - we can map distinct elements of A to distinct elements of B (i.e. there is an injective function from A to B), and
 - $|A| \neq |B|$.
- ► This clearly makes sense for finite sets.
- What about infinite sets?
 Do they even have different cardinalities?

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

B7. Sets: Countability

Countable and Countably Infinite Sets

Definition (countably infinite and countable)

A set A is countably infinite if $|A| = |\mathbb{N}_0|$.

A set A is countable if $|A| < |\mathbb{N}_0|$.

A set is countable if it is finite or countably infinite.

- ▶ We can count the elements of a countable set one at a time.
- ► The objects are "discrete" (in contrast to "continuous").
- Discrete mathematics deals with all kinds of countable sets.

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

Countable Sets

Set of Even Numbers

B7. Sets: Countability

Theorem (set of even numbers is countably infinite)

The set of all even natural numbers is countably infinite,

i. e. $|\{n \mid n \in \mathbb{N}_0 \text{ and } n \text{ is even}\}| = |\mathbb{N}_0|$.

Proof Sketch.

We can pair every even number 2n with natural number n.

Set of Even Numbers

- \blacktriangleright even = $\{n \mid n \in \mathbb{N}_0 \text{ and } n \text{ is even}\}$
- ▶ Obviously: $even \subset \mathbb{N}_0$
- Intuitively, there are twice as many natural numbers as even numbers — no?
- ▶ Is $|even| < |\mathbb{N}_0|$?

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

Countable Sets

B7. Sets: Countability Set of Perfect Squares

Theorem (set of perfect squares is countably infinite)

The set of all perfect squares is countably infinite. i. e. $|\{n^2 \mid n \in \mathbb{N}_0\}| = |\mathbb{N}_0|$.

Proof Sketch.

We can pair every square number n^2 with natural number n.

Subsets of Countable Sets are Countable

In general:

Theorem (subsets of countable sets are countable)

Let A be a countable set. Every set B with $B \subseteq A$ is countable.

Proof.

Since A is countable there is an injective function f from A to \mathbb{N}_0 . The restriction of f to B is an injective function from B to \mathbb{N}_0 . \square

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

October 27, 2025

Set of the Positive Rationals Theorem (set of positive rationals is countably infinite) Set $\mathbb{Q}_+ = \{ n \mid n \in \mathbb{Q} \text{ and } n > 0 \} = \{ p/q \mid p, q \in \mathbb{N}_1 \}$ is countably infinite. Proof idea. M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science October 27, 2025

Union of Two Countable Sets is Countable

Theorem (union of two countable sets countable)

Let A and B be countable sets. Then $A \cup B$ is countable.

Proof sketch.

As A and B are countable there is an injective function f_A from A to \mathbb{N}_0 , analogously f_B from B to \mathbb{N}_0 .

We define function $f_{A \cup B}$ from $A \cup B$ to \mathbb{N}_0 as

$$f_{A\cup B}(e) = egin{cases} 2f_A(e) & ext{if } e\in A \ 2f_B(e)+1 & ext{otherwise} \end{cases}$$

This $f_{A \cup B}$ is an injective function from $A \cup B$ to \mathbb{N}_0 .

Integers and Rationals

B7. Sets: Countability

Theorem (sets of integers and rationals are countably infinite) The sets \mathbb{Z} and \mathbb{Q} are countably infinite.

Without proof (→ exercises)

Countable Sets

Union of More than Two Sets

Definition (arbitrary unions)

Let M be a set of sets. The union $\bigcup_{S \in M} S$ is the set with

$$x \in \bigcup_{S \in M} S$$
 iff exists $S \in M$ with $x \in S$.

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

October 27, 2025

Countable Union of Countable Sets Theorem Let M be a countable set of countable sets. Then $\bigcup_{S \in M} S$ is countable. Proof sketch. With $M = \{S_1, S_2, S_3, \dots\}$ (possibly finite) and each $S_i = \{x_{i1}, x_{i2}, \dots\}$ (possibly finite), we can use an analogous idea as for the countability of \mathbb{Q}_+ (skipping duplicates):

B7. Sets: Countability

Set of all Binary Trees is Countable

Theorem (set of all binary trees is countable)

The set $B = \{b \mid b \text{ is a binary tree}\}\$ is countable.

Proof

For $n \in \mathbb{N}_0$ the set B_n of all binary trees with n leaves is finite.

With $M = \{B_i \mid i \in \mathbb{N}_0\}$ the set of all binary trees is $B = \bigcup_{B' \in M} B'$.

Since M is a countable set of countable sets, B is countable.

B7. Sets: Countability

And Now?

We have seen several countably infinite sets.

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science

What about our original questions?

- ▶ Do all infinite sets have the same cardinality?
- ► Are they all countably infinite?

B7. Sets: Countability

Summary

- ▶ A set is countable if it has at most cardinality $|\mathbb{N}_0|$.
- ▶ If a set is countable and infinite, it is countably infinite.
- ightharpoonup Sets $\mathbb Z$ and $\mathbb Q$ are countably infinite.
- ► Every subset of a countable set is countable.
- ► Every countable union of countable sets is countable, in particular, the union of two countable sets is countable.

M. Helmert, G. Röger (University of Basel) Discrete Mathematics in Computer Science
