Reminder: Cardinality of the Power Set

Theorem

Let S be a finite set. Then $|\mathcal{P}(S)| = 2^{|S|}$.

Countable Sets

We already know:

- Sets with the same cardinality as \mathbb{N}_0 are called countably infinite.
- A countable set is finite or countably infinite.
- Every subset of a countable set is countable.
- The union of countably many countable sets is countable.

Countable Sets

We already know:

- Sets with the same cardinality as \mathbb{N}_0 are called countably infinite.
- A countable set is finite or countably infinite.
- Every subset of a countable set is countable.
- The union of countably many countable sets is countable.

Open questions (to be resolved today):

- Do all infinite sets have the same cardinality?
- Does the power set of an infinite set S have the same cardinality as S?

Georg Cantor

- German mathematician (1845–1918)
- Proved that the rational numbers are countable.
- Proved that the real numbers are not countable.
- Cantor's Theorem: For every set S it holds that $|S| < |\mathcal{P}(S)|$.

Our Plan

- Understand Cantor's theorem
- Understand an important theoretical implication for computer science

```
S = \{a, b, c\}.
```

Consider an arbitrary function from S to $\mathcal{P}(S)$. For example:

$$S = \{a, b, c\}.$$

Consider an arbitrary function from S to $\mathcal{P}(S)$. For example:

We can identify an "unused" element of $\mathcal{P}(S)$.

$$S = \{a, b, c\}.$$

Consider an arbitrary function from S to $\mathcal{P}(S)$. For example:

```
a 1 0 1 a mapped to {a, c}
b 1 1 0 b mapped to {a, b}
c 0 1 0 c mapped to {b}
0 0 1 nothing was mapped to {c}.
```

We can identify an "unused" element of $\mathcal{P}(S)$. Complement the entries on the main diagonal.

$$S = \{a, b, c\}.$$

Consider an arbitrary function from S to $\mathcal{P}(S)$. For example:

```
      a
      1
      0
      1
      a mapped to {a, c}

      b
      1
      1
      0
      b mapped to {a, b}

      c
      0
      1
      0
      c mapped to {b}

      0
      0
      1
      nothing was mapped to {c}.
```

We can identify an "unused" element of $\mathcal{P}(S)$. Complement the entries on the main diagonal.

Works with every function from S to $\mathcal{P}(S)$.

- \rightarrow there cannot be a surjective function from S to $\mathcal{P}(S)$.
- \rightarrow there cannot be a bijection from S to $\mathcal{P}(S)$.

Cantor's Diagonal Argument on a Countably Infinite Set

$$S=\mathbb{N}_0$$
.

Consider an arbitrary function from \mathbb{N}_0 to $\mathcal{P}(\mathbb{N}_0)$.

For example:

```
0 1 0 1 0 1 ...
1 1 1 0 1 0 ...
2 0 1 0 1 0 ...
3 1 1 0 0 0 ...
4 1 1 0 1 1 ...
: : : : : : : ...
```

Cantor's Diagonal Argument on a Countably Infinite Set

$$S=\mathbb{N}_0$$
.

Consider an arbitrary function from \mathbb{N}_0 to $\mathcal{P}(\mathbb{N}_0)$. For example:

```
      0
      1
      2
      3
      4
      ...

      0
      1
      0
      1
      0
      1
      ...

      1
      1
      1
      0
      1
      0
      ...

      2
      0
      1
      0
      1
      0
      ...

      3
      1
      1
      0
      0
      0
      ...

      4
      1
      1
      0
      1
      1
      ...

      :
      :
      :
      :
      :
      :
      ...

      0
      0
      1
      1
      0
      ...
```

Complementing the entries on the main diagonal again results in an "unused" element of $\mathcal{P}(\mathbb{N}_0)$.

Theorem (Cantor's Theorem)

For every set S it holds that $|S| < |\mathcal{P}(S)|$.

Theorem (Cantor's Theorem)

For every set S it holds that $|S| < |\mathcal{P}(S)|$.

Proof.

Consider an arbitrary set S. We need to show that

- **1** There is an injective function from S to $\mathcal{P}(S)$.
- ② There is no bijection from S to $\mathcal{P}(S)$.

. .

Theorem (Cantor's Theorem)

For every set S it holds that $|S| < |\mathcal{P}(S)|$.

Proof.

Consider an arbitrary set S. We need to show that

- **1** There is an injective function from S to $\mathcal{P}(S)$.
- ② There is no bijection from S to $\mathcal{P}(S)$.

For 1, consider function $f: S \to \mathcal{P}(S)$ with $f(x) = \{x\}$. It maps distinct elements of S to distinct elements of $\mathcal{P}(S)$.

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Consider $M = \{x \mid x \in S, x \notin f(x)\}$ and note that $M \in \mathcal{P}(S)$.

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Consider $M = \{x \mid x \in S, x \notin f(x)\}$ and note that $M \in \mathcal{P}(S)$.

Since f is bijective, it is surjective and there is an $y \in S$ with f(y) = M. Consider this y in a case distinction:

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Consider $M = \{x \mid x \in S, x \notin f(x)\}$ and note that $M \in \mathcal{P}(S)$.

Since f is bijective, it is surjective and there is an $y \in S$ with f(y) = M. Consider this y in a case distinction:

If $y \in M$ then $y \notin f(y)$ by the definition of M. Since f(y) = M this implies $y \notin M$. \leadsto contradiction

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Consider $M = \{x \mid x \in S, x \notin f(x)\}$ and note that $M \in \mathcal{P}(S)$.

Since f is bijective, it is surjective and there is an $y \in S$ with f(y) = M. Consider this y in a case distinction:

If $y \in M$ then $y \notin f(y)$ by the definition of M. Since f(y) = M this implies $y \notin M$. \leadsto contradiction

If $y \notin M$, we conclude from f(y) = M that $x \notin f(x)$. Using the definition of M we get that $x \in M$. \leadsto contradiction

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Consider $M = \{x \mid x \in S, x \notin f(x)\}$ and note that $M \in \mathcal{P}(S)$.

Since f is bijective, it is surjective and there is an $y \in S$ with f(y) = M. Consider this y in a case distinction:

If $y \in M$ then $y \notin f(y)$ by the definition of M. Since f(y) = M this implies $y \notin M$. \rightsquigarrow contradiction

If $y \notin M$, we conclude from f(y) = M that $x \notin f(x)$. Using the definition of M we get that $x \in M$. \leadsto contradiction

Since all cases lead to a contradiction, there is no such x and thus f is not surjective and consequently not a bijection.

Proof (continued).

We show 2 by contradiction.

Assume there is a bijection f from S to $\mathcal{P}(S)$.

Consider $M = \{x \mid x \in S, x \notin f(x)\}$ and note that $M \in \mathcal{P}(S)$.

Since f is bijective, it is surjective and there is an $y \in S$ with f(y) = M. Consider this y in a case distinction:

If $y \in M$ then $y \notin f(y)$ by the definition of M. Since f(y) = M this implies $y \notin M$. \leadsto contradiction

If $y \notin M$, we conclude from f(y) = M that $x \notin f(x)$. Using the definition of M we get that $x \in M$. \leadsto contradiction

Since all cases lead to a contradiction, there is no such x and thus f is not surjective and consequently not a bijection.

The assumption was false and we conclude that there is no bijection from S to $\mathcal{P}(S)$.

Consequences of Cantor's Theorem

Infinite Sets can Have Different Cardinalities

There are infinitely many different cardinalities of infinite sets:

- $|\mathbb{N}_0| < |\mathcal{P}(\mathbb{N}_0))| < |\mathcal{P}(\mathcal{P}(\mathbb{N}_0)))| < \dots$
- $|\mathcal{P}(\mathbb{N}_0)| = \beth_1(=|\mathbb{R}|)$
- $|\mathcal{P}(\mathcal{P}(\mathbb{N}_0))| = \beth_2$
- **.** . . .

Existence of Unsolvable Problems

There are more problems in computer science than there are programs to solve them.

Existence of Unsolvable Problems

There are more problems in computer science than there are programs to solve them.

There are problems that cannot be solved by a computer program!

Existence of Unsolvable Problems

There are more problems in computer science than there are programs to solve them.

There are problems that cannot be solved by a computer program!

Why can we say so?

Decision Problems

"Intuitive Definition:" Decision Problem

A decision problem is a Yes-No question of the form "Does the given input have a certain property?"

- "Does the given binary tree have more than three leaves?"
- "Is the given integer odd?"
- "Given a train schedule, is there a connection from Basel to Belinzona that takes at most 2.5 hours?"

Decision Problems

"Intuitive Definition:" Decision Problem

A decision problem is a Yes-No question of the form "Does the given input have a certain property?"

- "Does the given binary tree have more than three leaves?"
- "Is the given integer odd?"
- "Given a train schedule, is there a connection from Basel to Belinzona that takes at most 2.5 hours?"
- Input can be encoded as some finite string.
- Problem can also be represented as the (possibly infinite) set of all input strings where the answer is "yes".

Decision Problems

"Intuitive Definition:" Decision Problem

A decision problem is a Yes-No question of the form "Does the given input have a certain property?"

- "Does the given binary tree have more than three leaves?"
- "Is the given integer odd?"
- "Given a train schedule, is there a connection from Basel to Belinzona that takes at most 2.5 hours?"
- Input can be encoded as some finite string.
- Problem can also be represented as the (possibly infinite) set of all input strings where the answer is "yes".
- A computer program solves a decision problem if it terminates on every input and returns the correct answer.

- A computer program is given by a finite string.
- A decision problem corresponds to a set of strings.

- Consider an arbitrary finite set of symbols (an alphabet) Σ .
- You can think of $\Sigma = \{0, 1\}$ as internally computers operate on binary representation.

- Consider an arbitrary finite set of symbols (an alphabet) Σ .
- You can think of $\Sigma = \{0, 1\}$ as internally computers operate on binary representation.
- Let S be the set of all finite strings made from symbols in Σ .

- Consider an arbitrary finite set of symbols (an alphabet) Σ .
- You can think of $\Sigma = \{0, 1\}$ as internally computers operate on binary representation.
- Let S be the set of all finite strings made from symbols in Σ .
- There are at most |S| computer programs with this alphabet.
- There are at least $|\mathcal{P}(S)|$ problems with this alphabet.
 - every subset of S corresponds to a separate decision problem

- Consider an arbitrary finite set of symbols (an alphabet) Σ .
- You can think of $\Sigma = \{0,1\}$ as internally computers operate on binary representation.
- Let S be the set of all finite strings made from symbols in Σ .
- There are at most |S| computer programs with this alphabet.
- There are at least $|\mathcal{P}(S)|$ problems with this alphabet.
 - lacktriangle every subset of S corresponds to a separate decision problem
- By Cantor's theorem |S| < |P(S)|, so there are more problems than programs.

Sets: Summary

Summary

- Cantor's theorem: For all sets S it holds that |S| < |P(S)|.
- There are problems that cannot be solved by a computer program.

Outlook: Finite Sets and Computer Science

Enumerating all Subsets

Determine a one-to-one mapping between numbers $0, \dots, 2^{|S|} - 1$ and all subsets of finite set S:

$$S = \{a, b, c\}$$

- Consider the binary representation of numbers $0, \dots, 2^{|S|} 1$.
- Associate every bit with a different element of S.
- Every number is mapped to the set that contains exactly the elements associated with the 1-bits.

set	binary	decimal
	abc	
{}	000	0
{ <i>c</i> }	001	1
{b}	010	2
$\{b,c\}$	011	3
{a}	100	4
$\{a,c\}$	101	5
$\{a,b\}$	110	6
$\{a,b,c\}$	111	7

Computer Representation as Bit String

Same representation as in enumeration of all subsets:

- Required: Fixed universe *U* of possible elements
- \blacksquare Represent sets as bitstrings of length |U|
- Associate every bit with one object from the universe
- Each bit is 1 iff the corresponding object is in the set

Computer Representation as Bit String

Same representation as in enumeration of all subsets:

- Required: Fixed universe *U* of possible elements
- lacktriangleright Represent sets as bitstrings of length |U|
- Associate every bit with one object from the universe
- Each bit is 1 iff the corresponding object is in the set

Example:

- $U = \{o_0, \ldots, o_9\}$
- Associate the i-th bit (0-indexed, from left to right) with o_i
- $\{o_2, o_4, o_5, o_9\}$ is represented as: 0010110001

Computer Representation as Bit String

Same representation as in enumeration of all subsets:

- Required: Fixed universe *U* of possible elements
- \blacksquare Represent sets as bitstrings of length |U|
- Associate every bit with one object from the universe
- Each bit is 1 iff the corresponding object is in the set

Example:

- $U = \{o_0, \ldots, o_9\}$
- Associate the i-th bit (0-indexed, from left to right) with o_i
- $\{o_2, o_4, o_5, o_9\}$ is represented as: 0010110001

How can the set operations be implemented?
