A1. Organizational Matters

Target Audience & Rules

#### Target Audience

#### target audience:

- ► M.Sc. Computer Science
  - Major in Machine Intelligence: module Concepts of Machine Intelligence module Methods of Machine Intelligence
  - Major in Distributed Systems: module Applications of Distributed Systems
- ► M.A. Computer Science ("Master-Studienfach") module Concepts of Machine Intelligence
- ► M.Sc. Data Science: module Electives in Data Science
- other students welcome

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

A1. Organizational Matters

Target Audience & Rules

#### Prerequisites

#### prerequisites:

- general computer science background: good knowledge of
  - algorithms and data structures
  - complexity theory
  - mathematical logic
  - programming
- background in Artificial Intelligence:
  - ► Foundations of Artificial Intelligence course (13548)
  - in particular chapters on state-space search

#### Gaps?

★ talk to us to discuss a self-study plan to catch up

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

13 / 26

A1. Organizational Matters

Exam

Target Audience & Rules

written examination (105 min)

▶ date and time: January 28, 14:00–16:00

place: Biozentrum, room U1.131

8 ECTS credits

▶ admission to exam: 50% of the exercise marks

▶ final grade based on exam exclusively

no repeat exam (except in case of illness)

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

A1. Organizational Matters

Target Audience & Rules

#### **Exercise Sheets**

#### exercise sheets (homework assignments):

- $\triangleright$  solved in groups of two or three (3 < 4), submitted in ADAM
- weekly homework assignments
  - released Monday before the lecture
  - have questions or need help?
    - → assistance provided in Wednesday exercises
  - not sure if you need help?
    - → start before Wednesday!
  - due following Monday at 23:59
- mixture of theory, programming and experiments
- range from basic understanding to research-oriented

A1. Organizational Matters

Target Audience & Rules

### Programming Exercises

#### programming exercises:

- part of regular assignments
- solutions that obviously do not work: 0 marks
- ▶ work with existing C++ and Python code

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

A1. Organizational Matters

Target Audience & Rules

#### **Exercise Sessions**

#### exercise sessions:

- ask questions about current assignments (and course)
- work on homework assignments
- discuss past homework assignments

M. Helmert, G. Röger (Universität Basel)

A1. Organizational Matters

Planning and Optimization

September 17, 2025

7 / 26

Target Audience & Rules

#### Plagiarism in Exercises

- ➤ You may discuss material from the course, including the exercise assignments, with your peers.
- ▶ But: You have to independently write down your exercise solutions (in your team).
- ▶ Help from an LLM is acceptable to the same extent as it is acceptable from someone who is not a member of your team.

#### Immediate consequences of plagiarism:

- ▶ 0 marks for the exercise sheet (first time)
- exclusion from exam (second time)

If in doubt: check with us what is (and isn't) OK before submitting Exercises too difficult? We are happy to help!

A1. Organizational Matters

Target Audience & Rules

#### **Plagiarism**

#### **Plagiarism**

Plagiarism is presenting someone else's work, ideas, or words as your own, without proper attribution.

#### For example:

- ▶ Using someone's text without citation
- ► Paraphrasing too closely
- Using information from a source without attribution
- Passing off Al-generated content as your own original work

#### Long-term impact:

- ► You undermine your own learning.
- ➤ You start to lose confidence in your ability to think, write, and solve problems independently.
- ▶ Damage to academic reputation and professional consequences in future careers

M. Helmert, G. Röger (Universität Basel)

Planning and Optimizatio

September 17, 2025

18 / 26

A1. Organizational Matters

Target Audience & Rules

### Special Needs?

M. Helmert, G. Röger (Universität Basel)

- ► We (and the university) strive for equality of students with disabilities or chronic illnesses.
- ► Contact the lecturers for small adaptations.
- ► Contact the Students Without Barriers (StoB) service point for general adaptations and disadvantage compensation.

Planning and Optimization

September 17, 2025

F / O

A2. What is Planning?

## General Problem Solving

#### Wikipedia: General Problem Solver

General Problem Solver (GPS) was a computer program created in 1959 by Herbert Simon, J.C. Shaw, and Allen Newell intended to work as a universal problem solver machine.

Any formalized symbolic problem can be solved, in principle, by GPS. [...]

GPS was the first computer program which separated its knowledge of problems (rules represented as input data) from its strategy of how to solve problems (a generic solver engine).

- ★ these days called "domain-independent automated planning"

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

A2. What is Planning?

M. Helmert, G. Röger (Universität Basel)

Planning

## So What is Domain-Independent Automated Planning?

Automated Planning (Pithy Definition)

"Planning is the art and practice of thinking before acting."

— Patrik Haslum

Automated Planning (More Technical Definition)

"Selecting a goal-leading course of action

based on a high-level description of the world."

— Jörg Hoffmann

#### Domain-Independence of Automated Planning

Create one planning algorithm that performs sufficiently well on many application domains (including future ones).

Planning and Optimization September 17, 2025

General Perspective on Planning

Sole source of change vs.
exogenous events

vs.
partially
observable

Vs. stochastic
in standaneous
vs. durative

MAXIMIZE

A2. What is Planning?

## Model-based vs. Data-driven Approaches

Model-based approaches know the "inner workings" of the world 
→ reasoning

Data-driven approaches rely only on collected data from a black-box world 
→ learning

We focus on model-based approaches.

A2. What is Planning?

Planning

#### Planning Tasks

input to a planning algorithm: planning task

- ▶ initial state of the world
- actions that change the state
- goal to be achieved

#### output of a planning algorithm:

- plan: sequence of actions taking initial state to a goal state
- or confirmation that no plan exists

→ formal definitions later in the course

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

A2. What is Planning? Planning

## The Planning Research Landscape

- one of the major subfields of Artificial Intelligence (AI)
- represented at major AI conferences (IJCAI, AAAI, ECAI)
- ▶ annual specialized conference ICAPS (≈ 250 participants)
- major journals: general Al journals (AIJ, JAIR)

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

17 / 29

A2. What is Planning?

#### Classical Planning

This course covers classical planning:

- offline (static)
- discrete
- deterministic
- fully observable
- single-agent
- sequential (plans are action sequences)
- domain-independent

This is just one facet of planning.

Many others are studied in AI. Algorithmic ideas often (but not always) translate well to more general problems.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

10 / 20

A2. What is Planning?

6 I DI I T I

## More General Planning Topics

More general kinds of planning include:

- ▶ offline: online planning; planning and execution
- discrete: continuous planning (e.g., real-time/hybrid systems)
- deterministic: FOND planning; probabilistic planning
- single-agent: multi-agent planning; general game playing; game-theoretic planning
- ▶ fully observable: POND planning; conformant planning
- sequential: e.g., temporal planning

Domain-dependent planning problems in Al include:

- pathfinding, including grid-based and multi-agent (MAPF)
- continuous motion planning

A2. What is Planning?

Planning and Optimization

September 17, 2025

A2. What is Planning? How Hard is Planning?

## A2.3 How Hard is Planning?

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

25 / 29

Classical Planning as State-Space Search

classical planning as state-space search:

→ much more on this later in the course

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

26 / 20

A2. What is Planning?

How Hard is Planning?

## Is Planning Difficult?

Classical planning is computationally challenging:

- number of states grows exponentially with description size when using (propositional) logic-based representations
- provably hard (PSPACE-complete)

→ we prove this later in the course

problem sizes:

- ► Seven Bridges of Königsberg: 64 reachable states
- ightharpoonup standard benchmarks: some with  $ightharpoonup 10^{200}$  reachable states

A2. What is Planning? Summary

# A2.4 Summary

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 17, 2025

A2. What is Planning? Summar

## Summary

- planning = thinking before acting
- ► major subarea of Artificial Intelligence
- ▶ domain-independent planning = general problem solving
- classical planning = the "easy case" (deterministic, fully observable etc.)
- ▶ still hard enough!
  - → PSPACE-complete because of huge number of states
- ▶ often solved by state-space search
- number of states grows exponentially with input size

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

A3. Getting to Know a Planner

Fast Downward and VAL

#### Getting to Know a Planner

We now play around a bit with a planner and its input:

- ► look at problem formulation
- run a planner (= planning system/planning algorithm)
- validate plans found by the planner

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

- /

A3. Getting to Know a Planner

Fast Downward and VAL

#### Planner: Fast Downward

#### Fast Downward

We use the Fast Downward planner in this course

- because we know it well (developed by our research group)
- because it implements many search algorithms and heuristics
- because it is the classical planner most commonly used as a basis for other planners

→ https://www.fast-downward.org

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

B1. Transition Systems and Propositional Logic

Transition Systems

## Transition System Example

Transition systems are often depicted as directed arc-labeled graphs with decorations to indicate the initial state and goal states.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

B1. Transition Systems and Propositional Logic

Transition Systems

#### **Transition Systems**

Definition (Transition System)

A transition system is a 6-tuple  $\mathcal{T} = \langle S, L, c, T, s_0, S_{\star} \rangle$  where

- ► *S* is a finite set of states,
- L is a finite set of (transition) labels,
- $ightharpoonup c: L o \mathbb{R}_0^+$  is a label cost function,
- ▶  $T \subseteq S \times L \times S$  is the transition relation,
- $ightharpoonup s_0 \in S$  is the initial state, and
- ▶  $S_{\star} \subseteq S$  is the set of goal states.

We say that  $\mathcal{T}$  has the transition  $\langle s, \ell, s' \rangle$  if  $\langle s, \ell, s' \rangle \in \mathcal{T}$ .

We also write this as  $s \xrightarrow{\ell} s'$ , or  $s \rightarrow s'$  when not interested in  $\ell$ .

Note: Transition systems are also called state spaces.

B1. Transition Systems and Propositional Logic

Transition Systems

## **Deterministic Transition Systems**

Definition (Deterministic Transition System)

A transition system is called deterministic if for all states s and all labels  $\ell$ , there is at most one state s' with  $s \xrightarrow{\ell} s'$ .

Example: previously shown transition system

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

Transition Systems

Transition System Terminology (1)

We use common terminology from graph theory:

- ightharpoonup s' successor of s if  $s \to s'$
- ightharpoonup s predecessor of s' if  $s \rightarrow s'$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

3 / 21

B1. Transition Systems and Propositional Logic

Transition Systems

## Transition System Terminology (2)

We use common terminology from graph theory:

- s' reachable from s if there exists a sequence of transitions  $s^0 \xrightarrow{\ell_1} s^1, \ldots, s^{n-1} \xrightarrow{\ell_n} s^n$  s.t.  $s^0 = s$  and  $s^n = s'$ 
  - Note: n = 0 possible; then s = s'
  - $ightharpoonup s^0, \ldots, s^n$  is called (state) path from s to s'
  - $\blacktriangleright$   $\ell_1, \ldots, \ell_n$  is called (label) path from s to s'
  - $ightharpoonup s^0 \xrightarrow{\ell_1} s^1, \ldots, s^{n-1} \xrightarrow{\ell_n} s^n$  is called trace from s to s'
  - ▶ length of path/trace is *n*
  - cost of label path/trace is  $\sum_{i=1}^{n} c(\ell_i)$

B1. Transition Systems and Propositional Logic

Transition Systems

### Transition System Terminology (3)

We use common terminology from graph theory:

- ► s' reachable (without reference state) means reachable from initial state s<sub>0</sub>
- ▶ solution or goal path from s: path from s to some  $s' \in S_{\star}$ 
  - ▶ if s is omitted,  $s = s_0$  is implied
- $\triangleright$  transition system solvable if a goal path from  $s_0$  exists

B1. Transition Systems and Propositional Logic

B1. Transition Systems and Propositional Logic

Example: Blocks World

## The Need for Compact Descriptions

- ▶ We see from the blocks world example that transition systems are often far too large to be directly used as inputs to planning algorithms.
- ▶ We therefore need compact descriptions of transition systems.
- For this purpose, we will use propositional logic, which allows expressing information about  $2^n$  states as logical formulas over n state variables.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

Reminder: Propositional Logic

#### Syntax of Propositional Logic

#### Definition (Logical Formula)

Let A be a set of atomic propositions.

The logical formulas over A are constructed by finite application of the following rules:

- ightharpoonup and ightharpoonup are logical formulas (truth and falsity).
- ▶ For all  $a \in A$ , a is a logical formula (atom).
- ▶ If  $\varphi$  is a logical formula, then so is  $\neg \varphi$  (negation).
- $\blacktriangleright$  If  $\varphi$  and  $\psi$  are logical formulas, then so are  $(\varphi \lor \psi)$  (disjunction) and  $(\varphi \land \psi)$  (conjunction).

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

B1. Transition Systems and Propositional Logic

Reminder: Propositional Logic

## Syntactical Conventions for Propositional Logic

#### Abbreviations:

- $\blacktriangleright$   $(\varphi \to \psi)$  is short for  $(\neg \varphi \lor \psi)$  (implication)
- $(\varphi \leftrightarrow \psi)$  is short for  $((\varphi \rightarrow \psi) \land (\psi \rightarrow \varphi))$  (equijunction)
- parentheses omitted when not necessary:
  - ▶ (¬) binds more tightly than binary connectives
  - (∧) binds more tightly than (∨), which binds more tightly than  $(\rightarrow)$ , which binds more tightly than  $(\leftrightarrow)$

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

B1. Transition Systems and Propositional Logic

Reminder: Propositional Logic

#### Semantics of Propositional Logic

#### Definition (Interpretation, Model)

An interpretation of propositions A is a function  $I: A \to \{T, F\}$ .

Define the notation  $I \models \varphi$  (I satisfies  $\varphi$ ; I is a model of  $\varphi$ ;  $\varphi$  is true under I) for interpretations I and formulas  $\varphi$  by

- $\triangleright$   $I \models \top$
- $\triangleright$   $I \not\models \bot$
- ▶  $I \models a$  iff  $I(a) = \mathbf{T}$  (for all  $a \in A$ )
- $I \models (\varphi \lor \psi)$  iff  $(I \models \varphi \text{ or } I \models \psi)$
- ▶  $I \models (\varphi \land \psi)$  iff  $(I \models \varphi \text{ and } I \models \psi)$

Note: Interpretations are also called valuations or truth assignments.

B1. Transition Systems and Propositional Logic

Reminder: Propositional Logic

## Propositional Logic Terminology (1)

- ightharpoonup A logical formula  $\varphi$  is satisfiable if there is at least one interpretation I such that  $I \models \varphi$ .
- Otherwise it is unsatisfiable.
- $\triangleright$  A logical formula  $\varphi$  is valid or a tautology if  $I \models \varphi$  for all interpretations I.
- $\blacktriangleright$  A logical formula  $\psi$  is a logical consequence of a logical formula  $\varphi$ , written  $\varphi \models \psi$ , if  $I \models \psi$  for all interpretations I with  $I \models \varphi$ .
- $\blacktriangleright$  Two logical formulas  $\varphi$  and  $\psi$  are logically equivalent, written  $\varphi \equiv \psi$ , if  $\varphi \models \psi$  and  $\psi \models \varphi$ .

Question: How to phrase these in terms of models?

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 22, 2025

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

Reminder: Propositional Logic

## Propositional Logic Terminology (2)

- A logical formula that is a proposition a or a negated proposition  $\neg a$  for some atomic proposition  $a \in A$  is a literal.
- A formula that is a disjunction of literals is a clause. This includes unit clauses  $\ell$  consisting of a single literal and the empty clause  $\bot$  consisting of zero literals.
- A formula that is a conjunction of literals is a monomial. This includes unit monomials  $\ell$  consisting of a single literal and the empty monomial  $\top$  consisting of zero literals.

#### Normal forms:

- negation normal form (NNF)
- conjunctive normal form (CNF)
- disjunctive normal form (DNF)

Introduction

#### The State Explosion Problem

- We saw in blocks world:
  n blocks → number of states exponential in n
- ► same is true everywhere we look
- known as the state explosion problem

To represent transitions systems compactly, need to tame these exponentially growing aspects:

- states
- goal states
- transitions

State Variables

September 24, 2025

## Compact Descriptions of Transition Systems

How to specify huge transition systems without enumerating the states?

- represent different aspects of the world in terms of different (propositional) state variables
- ▶ individual state variables are atomic propositions→ a state is an interpretation of state variables
- n state variables induce 2<sup>n</sup> states
   → exponentially more compact than "flat" representations

Example:  $n^2$  variables suffice for blocks world with n blocks

lanning and Optimization

September 24, 2025

10 / 2

B2. Introduction to Planning Tasks

Operators and Effects

#### **Operators Representing Transitions**

How do we compactly represent transitions?

- most complex aspect of a planning task
- central concept: operators

Idea: one operator o for each transition label  $\ell$ , describing

- ▶ in which states s a transition  $s \xrightarrow{\ell} s'$  exists (precondition)
- ▶ how state s' differs from state s (effect)
- ightharpoonup what the cost of  $\ell$  is

B2. Introduction to Planning Tasks

Operators and Effects

## Syntax of Operators

#### Definition (Operator)

An operator o over state variables V is an object with three properties:

- ightharpoonup a precondition pre(o), a formula over V
- ▶ an effect eff(o) over V, defined later in this chapter
- ightharpoonup a cost  $cost(o) \in \mathbb{R}_0^+$

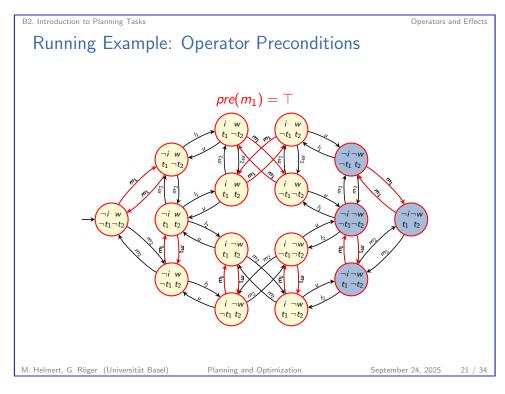

#### Notes:

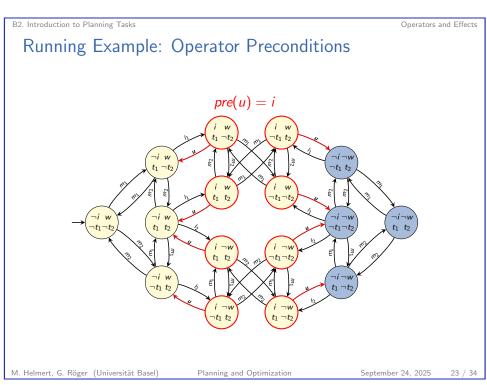

- ► Operators are also called actions.
- ▶ Operators are often written as triples  $\langle pre(o), eff(o), cost(o) \rangle$ .
- This can be abbreviated to pairs  $\langle pre(o), eff(o) \rangle$  when the cost of the operator is irrelevant.

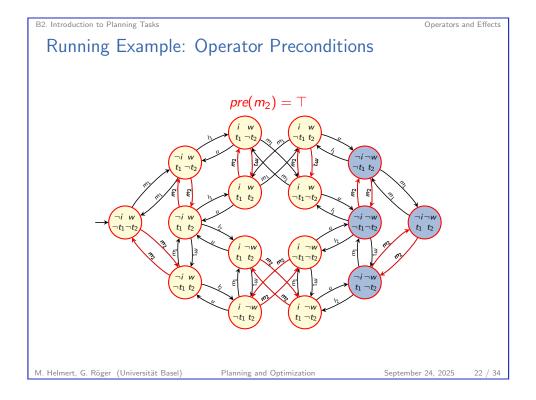

M. Helmert, G. Röger (Universität Basel)

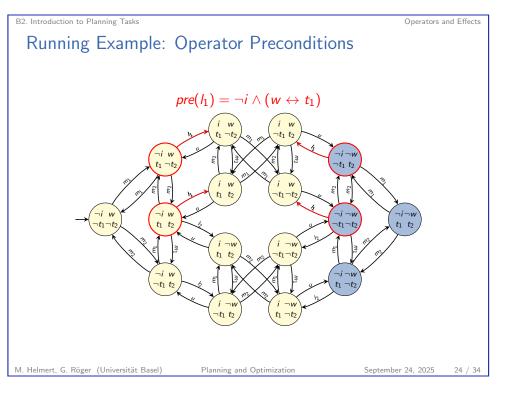

Planning and Optimization

September 24, 2025

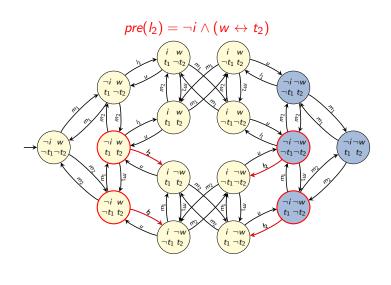

## Running Example: Operator Preconditions

Planning and Optimization

B2. Introduction to Planning Tasks

M. Helmert, G. Röger (Universität Basel)

Operators and Effects

September 24, 2025

#### Effects: Intuition

#### Intuition for effects:

- ▶ The empty effect  $\top$  changes nothing.
- Atomic effects can be understood as assignments that update the value of a state variable.
  - $\mathbf{v}$  means " $\mathbf{v} := \mathbf{T}$ "
  - $ightharpoonup \neg v \text{ means "} v := \mathbf{F}$ "
- A conjunctive effect  $e = (e' \land e'')$  means that both subeffects e and e' take place simultaneously.
- A conditional effect  $e = (\chi \triangleright e')$  means that subeffect e' takes place iff  $\chi$  is true in the state where e takes place.

## Syntax of Effects

B2. Introduction to Planning Tasks

#### Definition (Effect)

Effects over propositional state variables V are inductively defined as follows:

- ► ⊤ is an effect (empty effect).
- ▶ If  $v \in V$  is a propositional state variable, then v and  $\neg v$  are effects (atomic effect).
- If e and e' are effects, then  $(e \land e')$  is an effect (conjunctive effect).
- If  $\chi$  is a formula over V and e is an effect, then  $(\chi \triangleright e)$  is an effect (conditional effect).

We may omit parentheses when this does not cause ambiguity.

Example: we will later see that  $((e \wedge e') \wedge e'')$  behaves identically to  $(e \wedge (e' \wedge e''))$  and will write this as  $e \wedge e' \wedge e''$ .

Planning and Optimization

#### Semantics of Effects: Effect Conditions

#### Definition (Effect Condition for an Effect)

Let  $\ell$  be an atomic effect, and let e be an effect.

The effect condition effcond( $\ell$ , e) under which  $\ell$  triggers given the effect e is a propositional formula defined as follows:

- effcond( $\ell, \top$ ) =  $\bot$
- $effcond(\ell, e) = \top$  for the atomic effect  $e = \ell$
- effcond $(\ell, e) = \bot$  for all atomic effects  $e = \ell' \neq \ell$

Intuition: effcond( $\ell$ , e) represents the condition that must be true in the current state for the effect e to lead to the atomic effect  $\ell$ 

M. Helmert, G. Röger (Universität Basel)

B3. Formal Definition of Planning

M. Helmert, G. Röger (Universität Basel)

B3. Formal Definition of Planning

Example

Effect Condition: Example (1)

 $eff(m_1) = ((t_1 \rhd \neg t_1) \land (\neg t_1 \rhd t_1)).$ 

Under which conditions does it set  $t_1$  to false?

Consider the move operator  $m_1$  from the running example:

 $effcond(\neg t_1, eff(m_1)) = effcond(\neg t_1, ((t_1 \triangleright \neg t_1) \land (\neg t_1 \triangleright t_1)))$ 

 $= effcond(\neg t_1, (t_1 \rhd \neg t_1)) \lor$ 

 $effcond(\neg t_1, (\neg t_1 \triangleright t_1))$ 

 $= (t_1 \land effcond(\neg t_1, \neg t_1)) \lor$ 

 $(\neg t_1 \land effcond(\neg t_1, t_1))$ 

 $= (t_1 \wedge \top) \vee (\neg t_1 \wedge \bot)$ 

Planning and Optimization

 $\equiv t_1 \vee \bot$ 

 $\equiv t_1$ 

Semantics of Effects and Operators

September 24, 2025

# Semantics of Effects: Applying an Effect

#### first attempt:

#### Definition (Applying Effects)

Let V be a set of propositional state variables. Let s be a state over V, and let e be an effect over V.

The resulting state of applying e in s, written s[e]. is the state s' defined as follows for all  $v \in V$ :

$$s'(v) = \begin{cases} \mathbf{T} & \text{if } s \models \textit{effcond}(v, e) \\ \mathbf{F} & \text{if } s \models \textit{effcond}(\neg v, e) \land \neg \textit{effcond}(v, e) \\ s(v) & \text{otherwise} \end{cases}$$

What is the problem with this definition?

- effcond( $\ell$ , ( $e \land e'$ )) = (effcond( $\ell$ , e)  $\lor$  effcond( $\ell$ , e'))
- effcond $(\ell, (\chi \triangleright e)) = (\chi \land effcond(\ell, e))$

Planning and Optimization

September 24, 2025

Semantics of Effects and Operators

B3. Formal Definition of Planning

#### Effect Condition: Example (2)

#### Example

Consider the move operator  $m_1$  from the running example:  $eff(m_1) = ((t_1 \rhd \neg t_1) \land (\neg t_1 \rhd t_1)).$ 

Under which conditions does it set i to true?

$$\begin{split} \textit{effcond}(i,\textit{eff}(m_1)) &= \textit{effcond}(i,((t_1 \rhd \neg t_1) \land (\neg t_1 \rhd t_1))) \\ &= \textit{effcond}(i,(t_1 \rhd \neg t_1)) \lor \\ &\quad \textit{effcond}(i,(\neg t_1 \rhd t_1)) \\ &= (t_1 \land \textit{effcond}(i,\neg t_1)) \lor \\ &\quad (\neg t_1 \land \textit{effcond}(i,t_1)) \\ &= (t_1 \land \bot) \lor (\neg t_1 \land \bot) \\ &\equiv \bot \lor \bot \\ &\equiv \bot \end{split}$$

Planning and Optimization

September 24, 2025

B3. Formal Definition of Planning

# Mapping Planning Tasks to Transition Systems

#### Definition (Transition System Induced by a Planning Task)

The planning task  $\Pi = \langle V, I, O, \gamma \rangle$  induces the transition system  $\mathcal{T}(\Pi) = \langle S, L, c, T, s_0, S_{\star} \rangle$ , where

- S is the set of all states over V.
- L is the set of operators O.
- ightharpoonup c(o) = cost(o) for all operators  $o \in O$ .
- $T = \{\langle s, o, s' \rangle \mid s \in S, o \text{ applicable in } s, s' = s[o]\},$
- $\triangleright$   $s_0 = I$ , and

B3. Formal Definition of Planning

Planning Tasks

# Planning Tasks: Terminology

- ► Terminology for transitions systems is also applied to the planning tasks  $\Pi$  that induce them.
- $\triangleright$  For example, when we speak of the states of  $\Pi$ , we mean the states of  $\mathcal{T}(\Pi)$ .
- $\blacktriangleright$  A sequence of operators that forms a solution of  $\mathcal{T}(\Pi)$ is called a plan of  $\Pi$ .

Planning Tasks

B3. Formal Definition of Planning

Summai

# Summary

- ▶ Planning tasks compactly represent transition systems and are suitable as inputs for planning algorithms.
- A planning task consists of a set of state variables and an initial state, operators and goal over these state variables.
- ▶ We gave formal definitions for these concepts.
- ▶ In satisficing planning, we must find a solution for a planning task (or show that no solution exists).
- ► In optimal planning, we must additionally guarantee that generated solutions are of minimal cost.

Reminder & Motivation

# Reminder: Syntax of Effects

#### Definition (Effect)

Effects over propositional state variables V are inductively defined as follows:

- ▶ ⊤ is an effect (empty effect).
- ▶ If  $v \in V$  is a propositional state variable, then v and  $\neg v$  are effects (atomic effect).
- ▶ If e and e' are effects, then  $(e \land e')$  is an effect (conjunctive effect).
- ▶ If  $\chi$  is a formula over V and e is an effect, then  $(\chi \triangleright e)$  is an effect (conditional effect).

Arbitrary nesting of conjunctive and conditional effects, e.g.  $c \wedge (a \rhd (\neg b \wedge (c \rhd (b \wedge \neg d \wedge \neg a)))) \wedge (\neg b \rhd \neg a)$   $\rightsquigarrow$  Can we make our life easier?

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

5 / 28

n B4. Equivalent Operators and Normal Forms

Reminder & Motivation

#### Reminder: Semantics of Effects

- ▶  $effcond(\ell, e)$ : condition that must be true in the current state for the effect e to trigger the atomic effect  $\ell$
- add-after-delete semantics: if an operator with effect e is applied in state s and we have both  $s \models effcond(v, e)$  and  $s \models effcond(\neg v, e)$ , then  $s'(v) = \mathbf{T}$  in the resulting state s'.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

B4. Equivalent Operators and Normal Forms

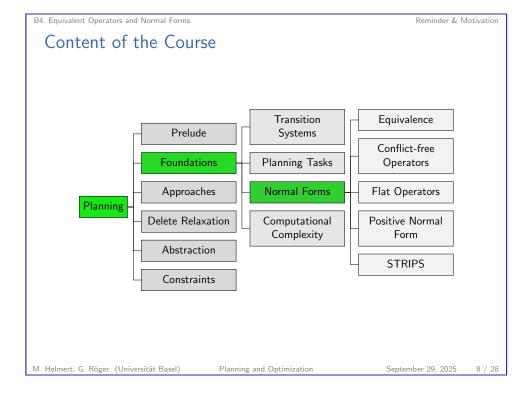

Reminder & Motivation

#### Motivation

Similarly to normal forms in propositional logic (DNF, CNF, NNF), we can define normal forms for effects, operators and planning tasks.

Among other things, we consider normal forms that avoid complicated nesting and subtleties of conflicts.

This is useful because algorithms (and proofs) then only need to deal with effects, operators and tasks in normal form.

Reminder & Motivation

# Notation: Applying Operator Sequences

#### Existing notation:

► We already write s[o] for the resulting state after applying operator o in state s.

#### New extended notation:

- For a sequence  $\pi = \langle o_1, \dots, o_n \rangle$  of operators that are consecutively applicable in s, we write  $s[\![\pi]\!]$  for  $s[\![o_1]\!]$   $[\![o_2]\!]$   $\dots [\![o_n]\!]$ .
- ▶ This includes the case of an empty operator sequence:  $s[\![\langle \rangle ]\!] = s$

Conflict-Free Operators

Conflict-Freeness: Motivation

► The add-after-delete semantics makes effects like  $(a \triangleright c) \land (b \triangleright \neg c)$  somewhat unintuitive to interpret.

- $\rightsquigarrow$  What happens in states where  $a \land b$  is true?
- ▶ It would be nicer if  $effcond(\ell, e)$  always were the condition under which the atomic effect  $\ell$  actually materializes (because of add-after-delete, it is not)
- → introduce normal form where "complicated case" never arises

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

17 / 28

B4. Equivalent Operators and Normal Forms

Conflict-Free Operators

#### Conflict-Free Effects and Operators

Definition (Conflict-Free)

An effect e over propositional state variables V is called conflict-free if  $effcond(v, e) \land effcond(\neg v, e)$  is unsatisfiable for all  $v \in V$ .

An operator o is called conflict-free if eff(o) is conflict-free.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

-- / --

B4. Equivalent Operators and Normal Forms

Conflict-Free Operators

#### Making Operators Conflict-Free

- ► In general, testing whether an operator is conflict-free is a coNP-complete problem. (Why?)
- ▶ However, we do not necessarily need such a test. Instead, we can produce an equivalent conflict-free operator in polynomial time.
- ▶ Algorithm: given operator o, replace all atomic effects of the form  $\neg v$  by  $(\neg effcond(v, eff(o)) \rhd \neg v)$ . The resulting operator o' is conflict-free and  $o \equiv o'$ . (Why?)

B4. Equivalent Operators and Normal Forms

Flat Effects

**B4 4 Flat Effects** 

Planning and Optimization

#### Flat Effect

M. Helmert, G. Röger (Universität Basel)

#### Definition (Flat Effect)

An effect is simple if it is either an atomic effect or of the form  $(\chi \rhd e)$ , where e is an atomic effect.

An effect *e* is flat if it is a conjunction of 0 or more simple effects, and none of these simple effects include the same atomic effect.

An operator o is flat if eff(o) is flat.

Notes: analogously to CNF, we consider

- ▶ a single simple effect as a conjunction of 1 simple effect
- ▶ the empty effect as a conjunction of 0 simple effects

B4. Equivalent Operators and Normal Forms

Flat Effects

#### Flat Effects: Motivation

- ► CNF and DNF limit the nesting of connectives in propositional logic.
- ► For example, a CNF formula is
  - ▶ a conjunction of 0 or more subformulas,
  - each of which is a disjunction of 0 or more subformulas,
  - each of which is a literal.
- ➤ Similarly, we can define a normal form that limits the nesting of effects.
- ➤ This is useful because we then do not have to consider arbitrarily structured effects, e.g., when representing them in a planning algorithm.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

. . . . . . . . . . . .

B4. Equivalent Operators and Normal Forms

Flat Effects

## Flat Effect: Example

#### Example

Consider the effect

$$c \wedge (a \rhd (\neg b \wedge (c \rhd (b \wedge \neg d \wedge \neg a)))) \wedge (\neg b \rhd \neg a)$$

An equivalent flat (and conflict-free) effect is

$$c \land \\ ((a \land \neg c) \rhd \neg b) \land \\ ((a \land c) \rhd b) \land \\ ((a \land c) \rhd \neg d) \land \\ ((\neg b \lor (a \land c)) \rhd \neg a)$$

Note: if we want, we can write c as  $(\top \triangleright c)$  to make the structure even more uniform, with each simple effect having a condition.

B4. Equivalent Operators and Normal Forms

# B4.5 Summary

B4. Equivalent Operators and Normal Forms

# Producing Flat Operators: Proof

#### Proof Sketch

Replace the effect e over variables V by

which is an equivalent flat effect.

To additionally obtain conflict-freeness, use

instead.

(Conjuncts of the form  $(\chi \triangleright e)$  where  $\chi \equiv \bot$ can be omitted to simplify the effect.)

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

26 / 28

B4. Equivalent Operators and Normal Forms

## Summary

- **Equivalences** can be used to simplify operators and effects.
- ▶ In conflict-free operators, the "complicated case" of operator semantics does not arise.
- For flat operators, the only permitted nesting is atomic effects within conditional effects within conjunctive effects, and all atomic effects must be distinct.
- ► For flat, conflict-free operators, it is easy to determine the condition under which a given literal is made true by applying the operator in a given state.
- ▶ Every operator can be transformed into an equivalent flat and conflict-free one in polynomial time.

B5. Positive Normal Form and STRIPS

Motivation

Example: Freecell

Example (Good and Bad Effects)

If we move  $K\diamondsuit$  to a free tableau position,

the good effect is that 4\$\mathbb{A}\$ is now accessible.

The bad effect is that we lose one free tableau position.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

September 29, 2025

B5. Positive Normal Form and STRIPS

Motivation

#### What is a Good or Bad Effect?

Question: Which operator effects are good, and which are bad?

Difficult to answer in general, because it depends on context:

- Locking our door is good if we want to keep burglars out.
- Locking our door is bad if we want to enter.

We now consider a reformulation of propositional planning tasks that makes the distinction between good and bad effects obvious.

Planning and Optimization

September 29, 2025

B5. Positive Normal Form and STRIPS

Positive Normal Form

#### Positive Normal Form: Algorithm

# Transformation of $\langle V, I, O, \gamma \rangle$ to Positive Normal Form

Replace all operators with equivalent conflict-free operators. Convert all conditions to negation normal form (NNF). **while** any condition contains a negative literal  $\neg v$ :

Let v be a variable which occurs negatively in a condition.  $V := V \cup \{\hat{v}\}$  for some new propositional state variable  $\hat{v}$ 

$$I(\hat{v}) := \begin{cases} \mathbf{F} & \text{if } I(v) = \mathbf{T} \\ \mathbf{T} & \text{if } I(v) = \mathbf{F} \end{cases}$$

Replace the effect v by  $(v \wedge \neg \hat{v})$  in all operators  $o \in O$ . Replace the effect  $\neg v$  by  $(\neg v \land \hat{v})$  in all operators  $o \in O$ . Replace  $\neg v$  by  $\hat{v}$  in all conditions.

Convert all operators  $o \in O$  to flat operators.

Here, all conditions refers to all operator preconditions, operator effect conditions and the goal.

B5. Positive Normal Form and STRIPS

Positive Normal Form

## Why Positive Normal Form is Interesting

In the absence of conditional effects, positive normal form allows us to distinguish good and bad effects easily:

- ► Effects that make state variables true (add effects) are good.
- Effects that make state variables false (delete effects) are bad.

This is particularly useful for planning algorithms based on delete relaxation, which we will study in Part D.

(Why restriction "in the absence of conditional effects"?)

B5. Positive Normal Form and STRIPS

# STRIPS Operators and Planning Tasks

#### Definition (STRIPS Operator)

An operator o of a prop. planning task is a STRIPS operator if

- pre(o) is a conjunction of state variables, and
- eff(o) is a conflict-free conjunction of atomic effects.

#### Definition (STRIPS Planning Task)

A propositional planning task  $\langle V, I, O, \gamma \rangle$  is a STRIPS planning task if all operators  $o \in O$  are STRIPS operators and  $\gamma$  is a conjunction of state variables.

Note: STRIPS operators are conflict-free and flat. STRIPS is a special case of positive normal form. B5. Positive Normal Form and STRIPS

# STRIPS Operators: Remarks

Every STRIPS operator is of the form

$$\langle v_1 \wedge \cdots \wedge v_n, \ell_1 \wedge \cdots \wedge \ell_m \rangle$$

where  $v_i$  are state variables and  $\ell_i$  are atomic effects.

- ▶ Often, STRIPS operators o are described via three sets of state variables:
  - ▶ the preconditions (state variables occurring in pre(o))
  - $\triangleright$  the add effects (state variables occurring positively in eff(o))
  - ▶ the delete effects (state variables occurring negatively in eff(o))
- ▶ Definitions of STRIPS in the literature often do not require conflict-freeness. But it is easy to achieve and makes many things simpler.
- ► There exists a variant called STRIPS with negation where negative literals are also allowed in conditions.

Planning and Optimization

September 29, 2025

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

M. Helmert, G. Röger (Universität Basel)

B5. Positive Normal Form and STRIPS

STRIPS

Why STRIPS is Interesting

➤ STRIPS is particularly simple, yet expressive enough to capture general planning tasks.

- ► In particular, STRIPS planning is no easier than planning in general (as we will see in Chapters B6–B7).
- Many algorithms in the planning literature are only presented for STRIPS planning tasks (generalization is often, but not always, obvious).

B5. Positive Normal Form and STRIPS

Summ

**B5.4 Summary** 

B5. Positive Normal Form and STRIPS

STRIPS

#### Transformation to STRIPS

- ▶ Not every operator is equivalent to a STRIPS operator.
- ► However, each operator can be transformed into a set of STRIPS operators whose "combination" is equivalent to the original operator. (How?)
- ► However, this transformation may exponentially increase the number of operators. There are planning tasks for which such a blow-up is unavoidable.
- ➤ There are polynomial transformations of propositional planning tasks to STRIPS, but these do not lead to isomorphic transition systems (auxiliary states are needed). (They are, however, equivalent in a weaker sense.)

26 / 28

B5. Positive Normal Form and STRIPS

Summai

## Summary

- A positive task helps distinguish good and bad effects.

  The notion of positive tasks only exists for propositional tasks.
- ► A positive task with flat operators is in positive normal form.
- ► STRIPS is even more restrictive than positive normal form, forbidding complex preconditions and conditional effects.
- ▶ Both forms are expressive enough to capture general propositional planning tasks.
- ► Transformation to positive normal form is possible with polynomial size increase.
- ▶ Isomorphic transformations of propositional planning tasks to STRIPS can increase the number of operators exponentially; non-isomorphic polynomial transformations exist.

Planning and Optimization

B6. Computational Complexity of Planning: Background

Motivation

How Difficult is Planning?

- ► Using state-space search (e.g., using Dijkstra's algorithm on the transition system), planning can be solved in polynomial time in the number of states.
- ► However, the number of states is exponential in the number of state variables, and hence in general exponential in the size of the input to the planning algorithm.
- → Do non-exponential planning algorithms exist?
- → What is the precise computational complexity of planning?

Planning and Optimization

# Turing Machines

#### Definition (Nondeterministic Turing Machine)

A nondeterministic Turing machine (NTM) is a 6-tuple  $\langle \Sigma, \square, Q, q_0, q_Y, \delta \rangle$  with the following components:

- ▶ input alphabet  $\Sigma$  and blank symbol  $\square \notin \Sigma$ 
  - ► alphabets always nonempty and finite
  - ▶ tape alphabet  $\Sigma_{\square} = \Sigma \cup \{\square\}$
- ▶ finite set Q of internal states with initial state  $q_0 \in Q$ and accepting state  $q_Y \in Q$ 
  - ▶ nonterminal states  $Q' := Q \setminus \{q_Y\}$
- ▶ transition relation  $\delta: (Q' \times \Sigma_{\square}) \to 2^{Q \times \Sigma_{\square} \times \{-1,+1\}}$

Deterministic Turing machine (DTM):  $|\delta(q,s)|=1$  for all  $\langle q,s\rangle\in Q'\times\Sigma_{\square}$

#### Turing Machines: Accepted Words

- ► Initial configuration
  - ightharpoonup state  $q_0$
  - ▶ input word on tape, all other tape cells contain □
  - head on first symbol of input word
- ► Step
  - ▶ If in state q, reading symbol s, and  $\langle q', s', d \rangle \in \delta(q, s)$  then
  - $\blacktriangleright$  the NTM can transition to state g', replacing s with s' and moving the head one cell to the left/right (d = -1/+1).
- ▶ Input word  $(\in \Sigma^*)$  is accepted if some sequence of transitions brings the NTM from the initial configuration into state  $q_Y$ .

Complexity Classes

# Acceptance in Time and Space

Definition (Acceptance of a Language in Time/Space)

Let  $f: \mathbb{N}_0 \to \mathbb{N}_0$ .

A NTM accepts language  $L \subseteq \Sigma^*$  in time f if it accepts each  $w \in L$  within f(|w|) steps and does not accept any  $w \notin L$  (in any time).

It accepts language  $L \subseteq \Sigma^*$  in space f if it accepts each  $w \in L$  using at most f(|w|) tape cells and does not accept any  $w \notin L$ .

B6. Computational Complexity of Planning: Background

Complexity Classes

#### Polynomial Time and Space Classes

Let  $\mathcal{P}$  be the set of polynomials  $p : \mathbb{N}_0 \to \mathbb{N}_0$  whose coefficients are natural numbers.

Definition (P, NP, PSPACE, NPSPACE)

 $P = \bigcup_{p \in \mathcal{P}} \mathsf{DTIME}(p)$ 

 $NP = \bigcup_{p \in \mathcal{P}} NTIME(p)$ 

 $PSPACE = \bigcup_{p \in \mathcal{D}} DSPACE(p)$ 

 $\mathsf{NPSPACE} = \bigcup_{p \in \mathcal{P}} \mathsf{NSPACE}(p)$ 

B6. Computational Complexity of Planning: Background

Complexity Classes

# Polynomial Complexity Class Relationships

Theorem (Complexity Class Hierarchy)

 $P \subseteq NP \subseteq PSPACE = NPSPACE$ 

Proof.

 $P \subseteq NP$  and  $PSPACE \subseteq NPSPACE$  are obvious because deterministic Turing machines are a special case of nondeterministic ones.

 $NP \subseteq NPSPACE$  holds because a Turing machine can only visit polynomially many tape cells within polynomial time.

PSPACE = NPSPACE is a special case of a classical result known as Savitch's theorem (Savitch 1970).

# Decision Problems for Planning

Definition (Plan Existence)

Plan existence (PLANEX) is the following decision problem:

GIVEN: planning task  $\Pi$  QUESTION: Is there a plan for  $\Pi$ ?

→ decision problem analogue of satisficing planning

Definition (Bounded-Cost Plan Existence)

Bounded-cost plan existence (BCPLANEX)

is the following decision problem:

GIVEN: planning task  $\Pi$ , cost bound  $K \in \mathbb{N}_0$ 

QUESTION: Is there a plan for  $\Pi$  with cost at most K?

→ decision problem analogue of optimal planning

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 1, 2025

5 / 19

B7. Computational Complexity of Planning: Results

(Bounded-Cost) Plan Existence

Plan Existence vs. Bounded-Cost Plan Existence

Theorem (Reduction from PLANEX to BCPLANEX)

 $PLANEX \leq_{p} BCPLANEX$ 

#### Proof.

Consider a planning task  $\Pi$  with state variables V.

Let  $c_{\text{max}}$  be the maximal cost of all operators of  $\Pi$ .

Compute the number of states of  $\Pi$  as  $N = 2^{|V|}$ .

 $\Pi$  is solvable iff there is solution with cost at most  $c_{\text{max}} \cdot (N-1)$  because a solution need not visit any state twice.

- $\leadsto$  map instance  $\Pi$  of  $\operatorname{PLANEX}$  to instance  $\langle \Pi, c_{\mathsf{max}} \cdot (N-1) \rangle$  of  $\operatorname{BCPLANEX}$
- → polynomial reduction

Planning and Optimization

B7. Computational Complexity of Planning: Results

PSPACE-Completeness of Planning

#### PSPACE-Hardness

#### Idea: generic reduction

- For an arbitrary fixed DTM M with space bound polynomial p and input w, generate propositional planning task which is solvable iff M accepts w in space p(|w|).
- ▶ Without loss of generality, we assume  $p(n) \ge n$  for all n.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 1, 2025

B7. Computational Complexity of Planning: Results

PSPACE-Completeness of Planning

#### Reduction: State Variables

Let  $M = \langle \Sigma, \square, Q, q_0, q_Y, \delta \rangle$  be the fixed DTM, and let p be its space-bound polynomial.

Given input  $w_1 \dots w_n$ , define relevant tape positions  $X := \{-p(n), \dots, p(n)\}$ 

#### State Variables

- ▶ state<sub>q</sub> for all  $q \in Q$
- ▶ head<sub>i</sub> for all  $i \in X \cup \{-p(n) 1, p(n) + 1\}$
- ▶ content<sub>i,a</sub> for all  $i \in X$ ,  $a \in \Sigma_{\square}$

→ allows encoding a Turing machine configuration

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 1, 2025

B7. Computational Complexity of Planning: Results

PSPACE-Completeness of Planning

#### Reduction: Initial State

Let  $M = \langle \Sigma, \square, Q, q_0, q_Y, \delta \rangle$  be the fixed DTM, and let p be its space-bound polynomial.

Given input  $w_1 \dots w_n$ , define relevant tape positions  $X := \{-p(n), \dots, p(n)\}$ 

#### Initial State

#### Initially true:

- ▶ state<sub>q0</sub>
- ► head<sub>1</sub>
- ightharpoonup content<sub>i,wi</sub> for all  $i \in \{1, ..., n\}$
- ▶ content<sub>i.□</sub> for all  $i \in X \setminus \{1, ..., n\}$

Initially false:

all others

B7. Computational Complexity of Planning: Results

PSPACE-Completeness of Planning

#### Reduction: Operators

Let  $M = \langle \Sigma, \square, Q, q_0, q_Y, \delta \rangle$  be the fixed DTM, and let p be its space-bound polynomial.

Given input  $w_1 \dots w_n$ , define relevant tape positions  $X := \{-p(n), \dots, p(n)\}$ 

#### **Operators**

One operator for each transition rule  $\delta(q, a) = \langle q', a', d \rangle$  and each cell position  $i \in X$ :

- ▶ precondition:  $state_q \land head_i \land content_{i,a}$
- ▶ effect:  $\neg state_q \land \neg head_i \land \neg content_{i,a}$  $\land state_{a'} \land head_{i+d} \land content_{i,a'}$

Note that add-after-delete semantics are important here!

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

B7. Computational Complexity of Planning: Results

PSPACE-Completeness of Planning

Reduction: Goal

Let  $M = \langle \Sigma, \square, Q, q_0, q_Y, \delta \rangle$  be the fixed DTM, and let p be its space-bound polynomial.

Given input  $w_1 \dots w_n$ , define relevant tape positions  $X := \{-p(n), \dots, p(n)\}$ 

Goal

 $\mathsf{state}_{q_\mathsf{Y}}$

B7. Computational Complexity of Planning: Results

PSPACE-Completeness of Planning

## PSPACE-Completeness of STRIPS Plan Existence

Theorem (PSPACE-Completeness; Bylander, 1994)

PLANEX and BCPLANEX are PSPACE-complete. This is true even if only STRIPS tasks are allowed.

#### Proof.

Membership for BCPLANEX was already shown.

Hardness for  $\rm PLANEX$  follows because we just presented a polynomial reduction from an arbitrary problem in PSPACE to  $\rm PLANEX$ . (Note that the reduction only generates STRIPS tasks, after trivial cleanup to make them conflict-free.)

Membership for PLANEX and hardness for BCPLANEX follow from the polynomial reduction from PLANEX to BCPLANEX.

B7. Computational Complexity of Planning: Results

More Complexity Results

#### More Complexity Results

In addition to the basic complexity result presented in this chapter, there are many special cases, generalizations, variations and related problems studied in the literature:

- different planning formalisms
  - e.g., nondeterministic effects, partial observability, schematic operators, numerical state variables
- syntactic restrictions of planning tasks
  - e.g., without preconditions, without conjunctive effects, STRIPS without delete effects
- semantic restrictions of planning task
  - e.g., restricting variable dependencies ("causal graphs")
- particular planning domains

M. Helmert, G. Röger (Universität Basel)

► e.g., Blocksworld, Logistics, FreeCell

M. Helmert, G. Röger (Universität Basel) Planning and Optimization October 1, 2025 15

Planning and Optimization

October 1, 2025

# Complexity Results for Different Planning Formalisms

Some results for different planning formalisms:

- nondeterministic effects:
  - ▶ fully observable: EXP-complete (Littman, 1997)
  - ▶ unobservable: EXPSPACE-complete (Haslum & Jonsson, 1999)
  - partially observable: 2-EXP-complete (Rintanen, 2004)
- schematic operators:
  - ▶ usually adds one exponential level to PLANEX complexity
  - e.g., classical case EXPSPACE-complete (Erol et al., 1995)
- numerical state variables:
  - ▶ undecidable in most variations (Helmert, 2002)
  - decidable in restricted setting with at most two numeric state variables (Helal and Lakemeyer, 2025)

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 1, 2025

17 / 19

B7. Computational Complexity of Planning: Results

Summar

## Summary

- Classical planning is PSPACE-complete.
- This is true both for satisficing and optimal planning (rather, the corresponding decision problems).
- ► The hardness proof is a polynomial reduction that translates an arbitrary polynomial-space DTM into a STRIPS task:
  - ▶ DTM configurations are encoded by state variables.
  - Operators simulate transitions between DTM configurations.
  - ► The DTM accepts an input iff there is a plan for the corresponding STRIPS task.
- ► This implies that there is no polynomial algorithm for classical planning unless P = PSPACE.
- ► It also means that planning is not polynomially reducible to any problem in NP unless NP = PSPACE.

The Big Thre

## Satisficing or Optimal Planning?

must carefully distinguish:

- satisficing planning: any plan is OK (cheaper ones preferred)
- optimal planning: plans must have minimum cost

solved by similar techniques, but:

- details very different
- ► almost no overlap between best techniques for satisficing planning and best techniques for optimal planning
- many tasks that are trivial for satisficing planners are impossibly hard for optimal planners

C3. Progression and Regression Search

Progressio

## Planning by Forward Search: Progression

Progression: Computing the successor state s[o] of a state s with respect to an operator o.

Progression planners find solutions by forward search:

- start from initial state
- ► iteratively pick a previously generated state and progress it through an operator, generating a new state
- solution found when a goal state generated

pro: very easy and efficient to implement

Planning and Optimization

October 8, 2025

C3. Progression and Regression Search

#### Forward Search vs. Backward Search

Searching planning tasks in forward vs. backward direction is not symmetric:

- forward search starts from a single initial state; backward search starts from a set of goal states
- when applying an operator o in a state s in forward direction, there is a unique successor state s': if we just applied operator o and ended up in state s', there can be several possible predecessor states s
- → in most natural representation for backward search in planning, each search state corresponds to a set of world states

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

C3. Progression and Regression Search

#### Planning by Backward Search: Regression

Regression: Computing the possible predecessor states regr(S', o)of a set of states S' ("subgoal") given the last operator othat was applied.

→ formal definition in next chapter

Regression planners find solutions by backward search:

- start from set of goal states
- iteratively pick a previously generated subgoal (state set) and regress it through an operator, generating a new subgoal
- solution found when a generated subgoal includes initial state

pro: can handle many states simultaneously

con: basic operations complicated and expensive

C3. Progression and Regression Search

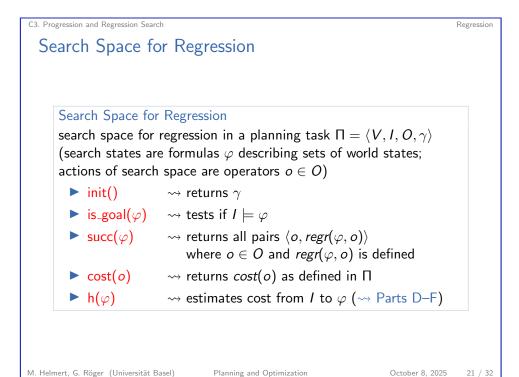

# Search Space Representation in Regression Planners

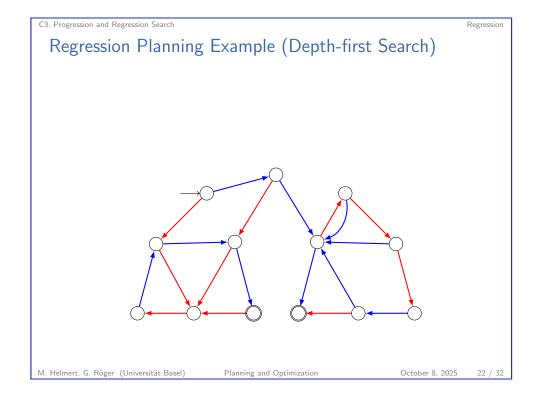

identify state sets with logical formulas (again):

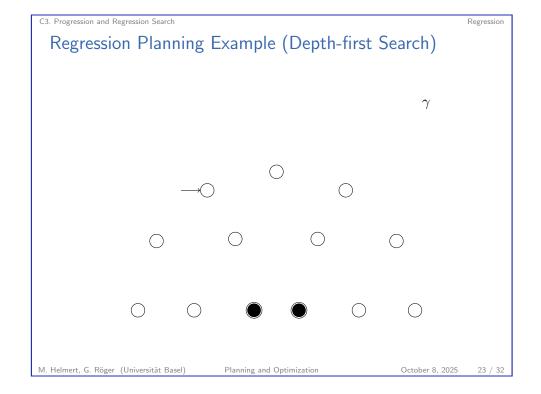

- each search state corresponds to a set of world states ("subgoal")
- each search state is represented by a logical formula:  $\varphi$  represents  $\{s \in S \mid s \models \varphi\}$
- many basic search operations like detecting duplicates are NP-complete or coNP-complete

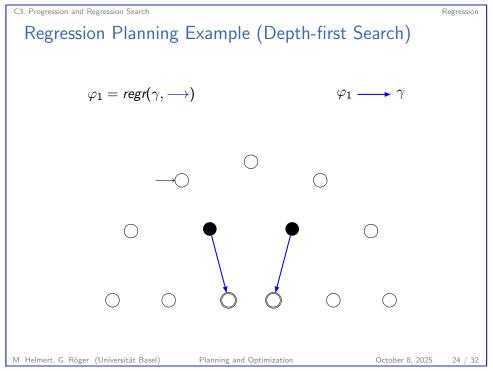

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

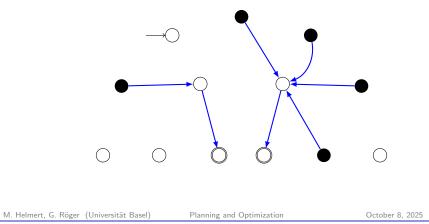

#### Regression Planning Example (Depth-first Search)

$$\varphi_1 = regr(\gamma, \longrightarrow)$$

$$\varphi_2 = regr(\varphi_1, \longrightarrow)$$

$$\varphi_2 \longrightarrow \varphi_1 \longrightarrow \gamma$$

# C3.4 Regression for STRIPS Tasks

C3. Progression and Regression Search

M. Helmert, G. Röger (Universität Basel)

Regression for STRIPS Tasks

October 8, 2025

## Regression for STRIPS Planning Tasks

Regression for STRIPS planning tasks is much simpler than the general case:

- $\triangleright$  Consider subgoal  $\varphi$  that is conjunction of atoms  $a_1 \wedge \cdots \wedge a_n$ (e.g., the original goal  $\gamma$  of the planning task).
- First step: Choose an operator o that deletes no a<sub>i</sub>.
- **Second step**: Remove any atoms added by o from  $\varphi$ .
- ▶ Third step: Conjoin pre(o) to  $\varphi$ .
- $\sim$  Outcome of this is regression of  $\varphi$  w.r.t. o. It is again a conjunction of atoms.

optimization: only consider operators adding at least one ai

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

C3. Progression and Regression Search

Regression for STRIPS Tasks

#### STRIPS Regression

#### Definition (STRIPS Regression)

Let  $\varphi = \varphi_1 \wedge \cdots \wedge \varphi_n$  be a conjunction of atoms, and let o be a STRIPS operator which adds the atoms  $a_1, \ldots, a_k$ and deletes the atoms  $d_1, \ldots, d_l$ .

The STRIPS regression of  $\varphi$  with respect to o is

$$\mathit{sregr}(arphi, o) := egin{cases} \bot & \mathsf{if} \ arphi_i = d_j \ \mathsf{for} \ \mathsf{some} \ i, j \ pre(o) \land \bigwedge(\{arphi_1, \ldots, arphi_n\} \setminus \{a_1, \ldots, a_k\}) \ & \mathsf{else} \end{cases}$$

Note:  $sregr(\varphi, o)$  is again a conjunction of atoms, or  $\bot$ .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

October 8, 2025

C3. Progression and Regression Search

# C3.5 Summary

C3. Progression and Regression Search

Regression for STRIPS Tasks

#### Does this Capture the Idea of Regression?

For our definition to capture the concept of regression, it must have the following property:

#### Regression Property

For all sets of states described by a conjunction of atoms  $\varphi$ , all states s and all STRIPS operators o,

$$s \models sregr(\varphi, o)$$
 iff  $s[o] \models \varphi$ .

This is indeed true. We do not prove it now because we prove this property for general regression (not just STRIPS) later.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

C3. Progression and Regression Search

#### Summary

- ▶ Progression search proceeds forward from the initial state.
- In progression search, the search space is identical to the state space of the planning task.
- ▶ Regression search proceeds backwards from the goal.
- Each search state corresponds to a set of world states, for example represented by a formula.
- ► Regression is simple for STRIPS operators.
- ▶ The theory for general regression is more complex. This is the topic of the following chapter.

# C4.1 Regressing State Variables

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

C4. General Regression

Regressing State Variables

#### Regressing State Variables: Motivation

#### Key question for general regression:

- Assume we are applying an operator with effect *e*.
- ► What must be true in the predecessor state for propositional state variable *v* to be true in the successor state?

If we can answer this question, a general definition of regression is only a small additional step.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025 6

C4. General Regression

Regressing State Variables

#### Regressing State Variables: Key Idea

Assume we are in state s and apply effect e to obtain successor state s'.

Propositional state variable v is true in s' iff

- effect e makes it true, or
- it remains true, i.e., it is true in s and not made false by e.

C4. General Regression

Regressing State Variables

# Regressing a State Variable Through an Effect

#### Definition (Regressing a State Variable Through an Effect)

Let e be an effect of a propositional planning task, and let  $\nu$  be a propositional state variable.

The regression of v through e, written regr(v, e), is defined as the following logical formula:

 $regr(v, e) = effcond(v, e) \lor (v \land \neg effcond(\neg v, e)).$ 

Does this capture add-after-delete semantics correctly?

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

#### Regressing State Variables: Example

#### Example

Let  $e = (b \triangleright a) \land (c \triangleright \neg a) \land b \land \neg d$ .

V	effcond(v, e)	$\textit{effcond}(\neg v, e)$	
а	Ь	С	$b \lor (a \land \neg c)$
Ь	T	$\perp$	$\top \lor (b \land \neg \bot) \equiv \top$
С	工	$\perp$	$\perp \lor (c \land \neg \bot) \equiv c$
d		Т	$b \lor (a \land \neg c)$ $\top \lor (b \land \neg \bot) \equiv \top$ $\bot \lor (c \land \neg \bot) \equiv c$ $\bot \lor (d \land \neg \top) \equiv \bot$

Reminder:  $regr(v, e) = effcond(v, e) \lor (v \land \neg effcond(\neg v, e))$ 

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

# Lemma (Correctness of regr(v, e))

Let s be a state, e be an effect and v be a state variable of a propositional planning task.

Regressing State Variables: Correctness (1)

Then  $s \models regr(v, e)$  iff  $s[e] \models v$ .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

C4. General Regression

Regressing State Variables

#### Regressing State Variables: Correctness (2)

#### Proof.

 $(\Rightarrow)$ : We know  $s \models regr(v, e)$ , and hence  $s \models effcond(v, e) \lor (v \land \neg effcond(\neg v, e)).$ 

Do a case analysis on the two disjuncts.

Case 1:  $s \models effcond(v, e)$ .

Then  $s[e] \models v$  by the first case in the definition of s[e] (Ch. B3).

Case 2:  $s \models (v \land \neg effcond(\neg v, e))$ .

Then  $s \models v$  and  $s \not\models effcond(\neg v, e)$ .

We may additionally assume  $s \not\models effcond(v, e)$ 

because otherwise we can apply Case 1 of this proof.

Then  $s[e] \models v$  by the third case in the definition of s[e].

Regressing State Variables

## Regressing State Variables: Correctness (3)

#### Proof (continued)

(⇐): Proof by contraposition.

We show that if regr(v, e) is false in s, then v is false in s[e].

- ▶ By prerequisite,  $s \not\models effcond(v, e) \lor (v \land \neg effcond(\neg v, e))$ .
- ▶ Hence  $s \models \neg effcond(v, e) \land (\neg v \lor effcond(\neg v, e))$ .
- ▶ From the first conjunct, we get  $s \models \neg effcond(v, e)$ and hence  $s \not\models effcond(v, e)$ .
- ▶ From the second conjunct, we get  $s \models \neg v \lor effcond(\neg v, e)$ .
- ▶ Case 1:  $s \models \neg v$ . Then v is false before applying eand remains false, so  $s[e] \not\models v$ .
- ▶ Case 2:  $s \models effcond(\neg v, e)$ . Then v is deleted by e and not simultaneously added, so  $s[e] \not\models v$ .

C4. General Regression

Regressing Formulas Through Effects

# C4.2 Regressing Formulas Through **Effects**

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

C4. General Regression

Regressing Formulas Through Effects

#### Regressing Formulas Through Effects: Idea

- ▶ We can now generalize regression from state variables to general formulas over state variables.
- ► The basic idea is to replace every occurrence of every state variable v by regr(v, e) as defined in the previous section.
- ▶ The following definition makes this more formal.

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

#### Regressing Formulas Through Effects: Definition

#### Definition (Regressing a Formula Through an Effect)

In a propositional planning task, let e be an effect, and let  $\varphi$  be a formula over propositional state variables.

The regression of  $\varphi$  through e, written  $regr(\varphi, e)$ , is defined as the following logical formula:

$$regr(\top, e) = \top$$
  
 $regr(\bot, e) = \bot$   
 $regr(v, e) = effcond(v, e) \lor (v \land \neg effcond(\neg v, e))$   
 $regr(\neg \psi, e) = \neg regr(\psi, e)$   
 $regr(\psi \lor \chi, e) = regr(\psi, e) \lor regr(\chi, e)$   
 $regr(\psi \land \chi, e) = regr(\psi, e) \land regr(\chi, e)$ .

#### Regressing Formulas Through Effects: Example

#### Example

Let 
$$e = (b \rhd a) \land (c \rhd \neg a) \land b \land \neg d$$
.

#### Recall:

- $ightharpoonup regr(a, e) \equiv b \lor (a \land \neg c)$
- $ightharpoonup regr(b,e) \equiv \top$
- $ightharpoonup regr(c,e) \equiv c$
- $ightharpoonup regr(d, e) \equiv \bot$

We get:

$$regr((a \lor d) \land (c \lor d), e) \equiv ((b \lor (a \land \neg c)) \lor \bot) \land (c \lor \bot)$$
$$\equiv (b \lor (a \land \neg c)) \land c$$
$$\equiv b \land c$$

# Regressing Formulas Through Effects: Correctness (1)

#### Lemma (Correctness of $regr(\varphi, e)$ )

Let  $\varphi$  be a logical formula, e an effect and s a state of a propositional planning task.

Then  $s \models regr(\varphi, e)$  iff  $s[e] \models \varphi$ .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

17 / 20

#### Proof.

The proof is by structural induction on  $\varphi$ .

Induction hypothesis:  $s \models regr(\psi, e)$  iff  $s[e] \models \psi$  for all proper subformulas  $\psi$  of  $\varphi$ .

Base case  $\varphi = T$ :

We have  $regr(\top, e) = \top$ , and  $s \models \top$  iff  $s[e] \models \top$  is correct.

Regressing Formulas Through Effects: Correctness (2)

Base case  $\varphi = \bot$ :

We have  $regr(\bot, e) = \bot$ , and  $s \models \bot$  iff  $s[e] \models \bot$  is correct.

Base case  $\varphi = v$ :

We have  $s \models regr(v, e)$  iff  $s[e] \models v$  from the previous lemma. . . .

M. Helmert, G. Röger (Universität Basel)

Planning and Optimization

October 8, 2025

18 /

C4. General Regression

Regressing Formulas Through Effects

## Regressing Formulas Through Effects: Correctness (3)

```
Proof (continued). Inductive case \varphi = \neg \psi:
```

$$\begin{aligned} s &\models \mathit{regr}(\neg \psi, e) \text{ iff } s \models \neg \mathit{regr}(\psi, e) \\ &\quad \text{iff } s \not\models \mathit{regr}(\psi, e) \\ &\quad \text{iff } s \llbracket e \rrbracket \not\models \psi \\ &\quad \text{iff } s \llbracket e \rrbracket \models \neg \psi \end{aligned}$$

#### Inductive case $\varphi = \psi \vee \chi$ :

$$s \models \mathit{regr}(\psi \lor \chi, e) \text{ iff } s \models \mathit{regr}(\psi, e) \lor \mathit{regr}(\chi, e)$$
 iff  $s \models \mathit{regr}(\psi, e) \text{ or } s \models \mathit{regr}(\chi, e)$  iff  $s[e] \models \psi \text{ or } s[e] \models \chi$  iff  $s[e] \models \psi \lor \chi$ 

#### Inductive case $\varphi = \psi \wedge \chi$ :

Like previous case, replacing " $\vee$ " by " $\wedge$ " and replacing "or" by "and".

C4. General Regression

Regressing Formulas Through Operators

## Regressing Formulas Through Operators: Definition

#### Definition (Regressing a Formula Through an Operator)

In a propositional planning task, let o be an operator, and let  $\varphi$  be a formula over state variables.

The regression of  $\varphi$  through o, written  $regr(\varphi, o)$ , is defined as the following logical formula:

$$regr(\varphi, o) = pre(o) \land regr(\varphi, eff(o)).$$

## Regressing Formulas Through Operators: Correctness (1)

#### Theorem (Correctness of $regr(\varphi, o)$ )

Let  $\varphi$  be a logical formula, o an operator and s a state of a propositional planning task.

Then  $s \models regr(\varphi, o)$  iff o is applicable in s and  $s[o] \models \varphi$ .

C4. General Regression

Regressing Formulas Through Operators

# Regressing Formulas Through Operators: Correctness (2)

Reminder:  $regr(\varphi, o) = pre(o) \land regr(\varphi, eff(o))$ 

Proof.

Case 1:  $s \models pre(o)$ .

Then o is applicable in s and the statement we must prove simplifies to:  $s \models regr(\varphi, e)$  iff  $s[e] \models \varphi$ , where e = eff(o). This was proved in the previous lemma.

Case 2:  $s \not\models pre(o)$ .

Then  $s \not\models regr(\varphi, o)$  and o is not applicable in s. Hence both statements are false and therefore equivalent.

Regressing Formulas Through Operators

# Regression Examples (1)

Examples: compute regression and simplify to DNF

- ►  $regr(b, \langle a, b \rangle)$   $\equiv a \land (\top \lor (b \land \neg \bot))$  $\equiv a$
- ► regr( $b \land c \land d, \langle a, b \rangle$ )  $\equiv a \land (\top \lor (b \land \neg \bot)) \land (\bot \lor (c \land \neg \bot)) \land (\bot \lor (d \land \neg \bot))$  $\equiv a \land c \land d$
- ► regr(b \land ¬c, \land a, b \land c \rangle) \( \equiv a \land (\tau \land (b \land ¬\perc )) \land ¬(\tau \land (c \land ¬\perc )) \( \equiv a \land \tau \land \perc \

C4. General Regression

C4.4 Summary

C4. General Regression

Summary

## Summary

- Regressing a propositional state variable through an (arbitrary) operator must consider two cases:
  - state variables made true (by add effects)
  - > state variables remaining true (by absence of delete effects)
- Regression of propositional state variables can be generalized to arbitrary formulas  $\varphi$  by replacing each occurrence of a state variable in  $\varphi$  by its regression.
- Regressing a formula  $\varphi$  through an operator involves regressing  $\varphi$  through the effect and enforcing the precondition.
