F2.2 Set Representation

F2.3 Landmarks from RTGs

F2.4 Summary

Content of the Course

F2.1 Landmarks

Landmarks

Basic Idea: Something that must happen **in every solution**

For example

- ▶ some operator must be applied (**action landmark**)
- ▶ some atomic proposition must hold (**fact landmark**)
- ▶ some formula must be true (**formula landmark**)

→ Derive heuristic estimate from this kind of information.

We mostly consider **fact** and **disjunctive action landmarks**.

Reminder: Terminology

Consider sequence of transitions $s^0 \xrightarrow{\ell_1} s^1, \dots, s^{n-1} \xrightarrow{\ell_n} s^n$ such that $s^0 = s$ and $s^n = s'$.

- ▶ s^0, \dots, s^n is called **(state) path** from s to s'
- ▶ ℓ_1, \dots, ℓ_n is called **(label) path** from s to s'

Disjunctive Action Landmarks

Definition (Disjunctive Action Landmark)

Let s be a state of a propositional or FDR planning task $\Pi = \langle V, I, O, \gamma \rangle$.

A **disjunctive action landmark** for s is a set of operators $L \subseteq O$ such that every label path from s to a goal state contains an operator from L .

The **cost** of landmark L is $cost(L) = \min_{o \in L} cost(o)$.

If we talk about landmarks for the initial state, we omit “for I ”.

Fact and Formula Landmarks

Definition (Formula and Fact Landmark)

Let s be a state of a propositional or FDR planning task $\Pi = \langle V, I, O, \gamma \rangle$.

A **formula landmark** for s is a formula λ over V such that every state path from s to a goal state contains a state s' with $s' \models \lambda$.

If λ is an atomic proposition then λ is a **fact landmark**.

If we talk about landmarks for the initial state, we omit “for I ”.

Landmarks: Example

Example

Consider a FDR planning task $\langle V, I, O, \gamma \rangle$ with

- ▶ $V = \{\text{robot-at}, \text{dishes-at}\}$ with
 - ▶ $\text{dom}(\text{robot-at}) = \{A1, \dots, C3, B4, A5, \dots, B6\}$
 - ▶ $\text{dom}(\text{dishes-at}) = \{\text{Table}, \text{Robot}, \text{Dishwasher}\}$
- ▶ $I = \{\text{robot-at} \mapsto C1, \text{dishes-at} \mapsto \text{Table}\}$
- ▶ operators
 - ▶ move-x-y to move from cell x to adjacent cell y
 - ▶ pickup dishes, and
 - ▶ load dishes into the dishwasher.
- ▶ $\gamma = (\text{robot-at} = B6) \wedge (\text{dishes-at} = \text{Dishwasher})$

Fact and Formula Landmarks: Example

Each fact in gray is a fact landmark:

- ▶ $\text{robot-at} = x$ for $x \in \{A1, A6, B3, B4, B5, B6, C1\}$
- ▶ $\text{dishes-at} = x$ for $x \in \{\text{Dishwasher}, \text{Robot}, \text{Table}\}$

Formula landmarks:

- ▶ $\text{dishes-at} = \text{Robot} \wedge \text{robot-at} = B4$
- ▶ $\text{robot-at} = B1 \vee \text{robot-at} = A2$

Disjunctive Action Landmarks: Example

Actions of same color form disjunctive action landmark:

- ▶ $\{\text{pickup}\}$
- ▶ $\{\text{load}\}$
- ▶ $\{\text{move-B3-B4}\}$
- ▶ $\{\text{move-B4-B5}\}$
- ▶ $\{\text{move-A6-B6}, \text{move-B5-B6}\}$
- ▶ $\{\text{move-A3-B3}, \text{move-B2-B3}, \text{move-C3-B3}\}$
- ▶ $\{\text{move-B1-A1}, \text{move-A2-A1}\}$
- ▶ ...

Remarks

- ▶ Not every landmark is informative. Some examples:
 - ▶ The set of all operators is a disjunctive action landmark unless the initial state is already a goal state.
 - ▶ Every variable that is initially true is a fact landmark.
 - ▶ The goal formula is a formula landmark.
- ▶ Every fact landmark v that is initially false induces a disjunctive action landmark consisting of all operators that possibly make v true.

Complexity: Disjunctive Action Landmarks

Theorem

Deciding whether a given operator set is a disjunctive action landmark is as hard as the plan existence problem.

Proof.

Given a propositional planning task $\Pi = \langle V, I, O, \gamma \rangle$, create a new planning task Π' with goal $g \notin V$ as $\Pi' = \langle V \cup \{g\}, I \cup \{g \mapsto \mathbf{F}\}, O \cup \{o_\gamma, o_\top\}, g \rangle$, where

$$o_\gamma = \langle \gamma, g, 0 \rangle, \text{ and} \\ o_\top = \langle \top, g, 0 \rangle.$$

If $\gamma = \top$ then Π is trivially solvable. Otherwise Π is solvable iff $\{o_\top\}$ is not a disjunctive action landmark of Π' . \square

Complexity: Fact Landmarks

Theorem

Deciding whether a given atomic proposition is a fact landmark is as hard as the plan existence problem.

Proof.

Given a propositional planning task $\Pi = \langle V, I, O, \gamma \rangle$, let $p, g \notin V$ be new atomic propositions and create a new planning task $\Pi' = \langle V \cup \{p, g\}, I \cup \{p \mapsto \mathbf{F}, g \mapsto \mathbf{F}\}, O \cup \{o, o'\}, g \rangle$, where

$$o = \langle \gamma, g, 0 \rangle, \text{ and} \\ o' = \langle \top, g \wedge p, 0 \rangle.$$

Then p is a fact landmark of Π' iff Π is not solvable. \square

Complexity: Discussion

- ▶ Does this mean that the idea of exploiting landmarks is fruitless?– No!
- ▶ We do not need to know **all** landmarks, so we can use incomplete methods to identify landmarks.
 - ▶ The way we generate the landmarks guarantees that they are indeed landmarks.
 - ▶ Efficient landmark generation methods do not guarantee to generate all possible landmarks.

Computing Landmarks

How can we come up with landmarks?

Most landmarks are derived from the **relaxed task graph**:

- ▶ RHW landmarks: Richter, Helmert & Westphal. Landmarks Revisited. (AAAI 2008)
- ▶ **LM-Cut**: Helmert & Domshlak. Landmarks, Critical Paths and Abstractions: What's the Difference Anyway? (ICAPS 2009)
- ▶ **h^m landmarks**: Keyder, Richter & Helmert: Sound and Complete Landmarks for And/Or Graphs (ECAI 2010)

Today we will discuss the special case of **h^m landmarks** for $m = 1$, restricted to STRIPS planning tasks.

F2.2 Set Representation

Set Representation of STRIPS Planning Tasks

In this (and the following) sections, we only consider STRIPS. For a more convenient notation, we will use a set representation of STRIPS planning task. . .

Three differences:

- ▶ Represent conjunctions of variables as sets of variables.
- ▶ Use two sets to represent add and delete effects of operators separately.
- ▶ Represent states as sets of the true variables.

STRIPS Operators in Set Representation

- ▶ Every STRIPS operator is of the form

$$\langle v_1 \wedge \dots \wedge v_p, \ a_1 \wedge \dots \wedge a_q \wedge \neg d_1 \wedge \dots \wedge \neg d_r, c \rangle$$

where v_i, a_j, d_k are state variables and c is the cost.

- ▶ The same operator o in **set representation** is $\langle pre(o), add(o), del(o), cost(o) \rangle$, where
 - ▶ $pre(o) = \{v_1, \dots, v_p\}$ are the **preconditions**,
 - ▶ $add(o) = \{a_1, \dots, a_q\}$ are the **add effects**,
 - ▶ $del(o) = \{d_1, \dots, d_r\}$ are the **delete effects**, and
 - ▶ $cost(o) = c$ is the operator cost.
- ▶ Since STRIPS operators must be conflict-free, $add(o) \cap del(o) = \emptyset$

STRIPS Planning Tasks in Set Representation

A **STRIPS planning task in set representation** is given as a tuple $\langle V, I, O, G \rangle$, where

- ▶ V is a finite set of state variables,
- ▶ $I \subseteq V$ is the initial state,
- ▶ O is a finite set of STRIPS operators in set representation,
- ▶ $G \subseteq V$ is the goal.

The corresponding planning task in the previous notation is $\langle V, I', O', \gamma \rangle$, where

- ▶ $I'(v) = \mathbf{T}$ iff $v \in I$,
- ▶ $O' = \{ \langle \bigwedge_{v \in pre(o)} v, \bigwedge_{v \in add(o)} v \wedge \bigwedge_{v \in del(o)} \neg v, cost(o) \rangle \mid o \in O \}$,
- ▶ $\gamma = \bigwedge_{v \in G} v$.

F2.3 Landmarks from RTGs

Content of the Course

Incidental Landmarks: Example

Example (Incidental Landmarks)

Consider a STRIPS planning task $\langle V, I, \{o_1, o_2\}, G \rangle$ with

$$V = \{a, b, c, d, e, f\},$$

$$I = \{a, b, e\},$$

$$o_1 = \langle \{a\}, \{c, d, e\}, \{b\} \rangle,$$

$$o_2 = \langle \{d, e\}, \{f\}, \{a\} \rangle, \text{ and}$$

$$G = \{e, f\}.$$

Single solution: $\langle o_1, o_2 \rangle$

- ▶ All variables are fact landmarks.
- ▶ Variable b is initially true but irrelevant for the plan.
- ▶ Variable c gets true as “side effect” of o_1 but it is not necessary for the goal or to make an operator applicable.

Causal Landmarks (1)

Definition (Causal Formula Landmark)

Let $\Pi = \langle V, I, O, \gamma \rangle$ be a propositional or FDR planning task.

A formula λ over V is a **causal formula landmark** for I if $\gamma \models \lambda$ or if for all plans $\pi = \langle o_1, \dots, o_n \rangle$ there is an o_i with $pre(o_i) \models \lambda$.

Causal Landmarks (2)

Special case: Fact Landmark for STRIPS task

Definition (Causal Fact Landmark)

Let $\Pi = \langle V, I, O, G \rangle$ be a STRIPS planning task (in set representation).

A variable $v \in V$ is a **causal fact landmark** for I

- ▶ if $v \in G$ or
- ▶ if for all plans $\pi = \langle o_1, \dots, o_n \rangle$ there is an o_i with $v \in \text{pre}(o_i)$.

Causal Landmarks: Example

Example (Causal Landmarks)

Consider a STRIPS planning task $\langle V, I, \{o_1, o_2\}, G \rangle$ with

$$V = \{a, b, c, d, e, f\},$$

$$I = \{a, b, e\},$$

$$o_1 = \langle \{a\}, \{c, d, e\}, \{b\} \rangle,$$

$$o_2 = \langle \{d, e\}, \{f\}, \{a\} \rangle, \text{ and}$$

$$G = \{e, f\}.$$

Single solution: $\langle o_1, o_2 \rangle$

- ▶ All variables are fact landmarks for the initial state.
- ▶ Only a, d, e and f are causal landmarks.

What We Are Doing Next

- ▶ Causal landmarks are the desirable landmarks.
- ▶ We can use a simplified version of RTGs for STRIPS to compute causal landmarks for STRIPS planning tasks.
- ▶ We will define landmarks of AND/OR graphs, ...
- ▶ and show how they can be computed.
- ▶ Afterwards we establish that these are landmarks of the planning task.

Simplified Relaxed Task Graph

Definition

For a STRIPS planning task $\Pi = \langle V, I, O, G \rangle$ (in set representation), the **simplified relaxed task graph** $sRTG(\Pi^+)$ is the **AND/OR graph** $\langle N_{\text{and}} \cup N_{\text{or}}, A, \text{type} \rangle$ with

- ▶ $N_{\text{and}} = \{n_o \mid o \in O\} \cup \{v_I, v_G\}$
with $\text{type}(n) = \wedge$ for all $n \in N_{\text{and}}$,
- ▶ $N_{\text{or}} = \{n_v \mid v \in V\}$
with $\text{type}(n) = \vee$ for all $n \in N_{\text{or}}$, and
- ▶ $A = \{ \langle n_a, n_o \rangle \mid o \in O, a \in \text{add}(o) \} \cup$
 $\{ \langle n_o, n_p \rangle \mid o \in O, p \in \text{pre}(o) \} \cup$
 $\{ \langle n_v, n_I \rangle \mid v \in I \} \cup$
 $\{ \langle n_G, n_v \rangle \mid v \in G \}$

Like RTG but without extra nodes to support arbitrary conditions.

Simplified RTG: Example

The simplified RTG for our example task is:

Justification

Definition (Justification)

Let $G = \langle N, A, type \rangle$ be an AND/OR graph.

A subgraph $J = \langle N^J, A^J, type^J \rangle$ with $N^J \subseteq N$ and $A^J \subseteq A$ and $type^J = type|_{N^J}$ **justifies** $n_* \in N$ iff

- ▶ $n_* \in N^J$,
- ▶ $\forall n \in N^J$ with $type(n) = \wedge$:
 $\forall \langle n, n' \rangle \in A : n' \in N^J$ and $\langle n, n' \rangle \in A^J$
- ▶ $\forall n \in N^J$ with $type(n) = \vee$:
 $\exists \langle n, n' \rangle \in A : n' \in N^J$ and $\langle n, n' \rangle \in A^J$, and
- ▶ J is acyclic.

“Proves” that n_* is forced true.

Landmarks in AND/OR Graphs

Definition (Landmarks in AND/OR Graphs)

Let $G = \langle N, A, type \rangle$ be an AND/OR graph.

A node $n \in N$ is a **landmark** for reaching $n_* \in N$ if $n \in V^J$ for all justifications J for n_* .

But: exponential number of possible justifications

Characterizing Equation System

Theorem

Let $G = \langle N, A, type \rangle$ be an AND/OR graph. Consider the following system of equations:

$$LM(n) = \{n\} \cup \bigcap_{\langle n, n' \rangle \in A} LM(n') \quad type(n) = \vee$$

$$LM(n) = \{n\} \cup \bigcup_{\langle n, n' \rangle \in A} LM(n') \quad type(n) = \wedge$$

The equation system has a unique maximal solution (maximal with regard to set inclusion), and for this solution it holds that

$n' \in LM(n)$ iff n' is a landmark for reaching n in G .

Computation of Maximal Solution

Theorem

Let $G = \langle N, A, \text{type} \rangle$ be an AND/OR graph. Consider the following system of equations:

$$LM(n) = \{n\} \cup \bigcap_{\langle n, n' \rangle \in A} LM(n') \quad \text{type}(n) = \vee$$

$$LM(n) = \{n\} \cup \bigcup_{\langle n, n' \rangle \in A} LM(n') \quad \text{type}(n) = \wedge$$

The equation system has a unique maximal solution (maximal with regard to set inclusion).

Computation: Initialize landmark sets as $LM(n) = N$ and apply equations as update rules until fixpoint.

Computation: Example

(cf. screen version of slides for step-wise computation)

Relation to Planning Task Landmarks

Theorem

Let $\Pi = \langle V, I, O, \gamma \rangle$ be a STRIPS planning task and let \mathcal{L} be the set of landmarks for reaching n_G in $sRTG(\Pi^+)$.

The set $\{v \in V \mid n_v \in \mathcal{L}\}$ is exactly the set of **causal fact landmarks** in Π^+ .

For operators $o \in O$, if $n_o \in \mathcal{L}$ then $\{o\}$ is a **disjunctive action landmark** in Π^+ .

There are no other disjunctive action landmarks of size 1.

(Proofs omitted.)

Computed RTG Landmarks: Example

Example (Computed RTG Landmarks)

Consider a STRIPS planning task $\langle V, I, \{o_1, o_2\}, G \rangle$ with

$$V = \{a, b, c, d, e, f\},$$

$$I = \{a, b, e\},$$

$$o_1 = \langle \{a\}, \{c, d, e\}, \{b\} \rangle,$$

$$o_2 = \langle \{d, e\}, \{f\}, \{a\} \rangle, \text{ and}$$

$$G = \{e, f\}.$$

- $LM(n_G) = \{a, d, e, f, I, G, o_1, o_2\}$
- a, d, e , and f are causal fact landmarks of Π^+ .
- $\{o_1\}$ and $\{o_2\}$ are disjunctive action landmarks of Π^+ .

(Some) Landmarks of Π^+ Are Landmarks of Π

Theorem

Let Π be a STRIPS planning task.

All fact landmarks of Π^+ are fact landmarks of Π and all disjunctive action landmarks of Π^+ are disjunctive action landmarks of Π .

Proof.

Let L be a disjunctive action landmark of Π^+ and π be a plan for Π . Then π is also a plan for Π^+ and, thus, π contains an operator from L .

Let f be a fact landmark of Π^+ . If f is already true in the initial state, then it is also a landmark of Π . Otherwise, every plan for Π^+ contains an operator that adds f and the set of all these operators is a disjunctive action landmark of Π^+ . Therefore, also each plan of Π contains such an operator, making f a fact landmark of Π . \square

Not All Landmarks of Π^+ are Landmarks of Π

Example

Consider STRIPS task $\langle \{a, b, c\}, \emptyset, \{o_1, o_2\}, \{c\} \rangle$ with $o_1 = \langle \{\}, \{a\}, \{\}, 1 \rangle$ and $o_2 = \langle \{a\}, \{c\}, \{a\}, 1 \rangle$.

$a \wedge c$ is a formula landmark of Π^+ but not of Π .

F2.4 Summary

Summary

- **Fact landmark**: atomic proposition that is true in each state path to a goal
- **Disjunctive action landmark**: set L of operators such that every plan uses some operator from L
- We can **efficiently compute all causal fact landmarks** of a delete-free STRIPS task from the (simplified) RTG.
- Fact landmarks of the delete relaxed task are also landmarks of the original task.
